For nearly 60 years, Simpson Strong-Tie has focused on providing powerful solutions to meet our customers' needs.

We offer a full array of anchoring systems for residential, commercial, infrastructure and industrial uses – from anchoring adhesives and mechanical anchors for anchoring applications in concrete and masonry to direct fastening solutions for attachments to concrete, steel, CMU, or metal deck.

The innovative products featured in this catalog are the result of more than 40 years of research and development, and have passed the rigorous quality-assurance testing you have come to expect from Simpson Strong-Tie. With our expanding lines of high-performance anchoring products, engineering and field support, product testing and training, we are committed to giving you the power to build.

Simpson Strong-Tie Company Inc.

For nearly 60 years, Simpson Strong-Tie has focused on creating structural products that help people build safer and stronger homes and buildings. A leader in structural systems research and technology, Simpson Strong-Tie is one of the largest suppliers of structural building products in the world. The Simpson Strong-Tie commitment to product development, engineering, testing and training is evident in the consistent quality and delivery of its products and services.

For more information, visit the company's website at www.strongtie.com.

The Simpson Strong-Tie Company Inc. "No Equal" pledge includes:

- Quality products value-engineered for the lowest installed cost at the highest-rated performance levels
- Most thoroughly tested and evaluated products in the industry
- Strategically located manufacturing and warehouse facilities
- National code agency listings
- Largest number of patented connectors in the industry
- Global locations with an international sales team
- In-house R&D and tool and die professionals
- In-house product testing and quality control engineers
- Support of industry groups including AISI, AITC, ASTM, ASCE, AWC, AWPA, ACI, AISC, CSI, CFSEI, ICFA, NBMDA, NLBMDA, SDI, SETMA, SFA, SFIA, STAFDA, SREA, NFBA, TPI, WDSC, WIJMA, WTCA and local engineering groups.

Product Identification Key

Products and additional information are divided into eight general categories, identified by tabs along the page's outer edge.

The Simpson Strong-Tie Quality Policy

We help people build safer structures economically. We do this by designing, engineering and manufacturing "No Equal" structural connectors and other related products that meet or exceed our customers' needs and expectations. Everyone is responsible for product quality and is committed to ensuring the effectiveness of the Quality Management System.

Karen Colonias
Chief Executive Officer

Getting Fast Technical Support

When you call for engineering technical support, we can help you quickly if you have the following information at hand. This will help us to serve you promptly and efficiently.

- Which Simpson Strong-Tie catalog are you using? (See the front cover for the form number.)
- Which Simpson Strong-Tie product are you using?
- What are the design requirements (i.e., loads, anchor diameter, base material, edge/spacing distance, etc.)?

We Are ISO 9001-2008 Registered

Simpson Strong-Tie is an ISO 9001-2008 registered company. ISO 9001-2008 is an internationally recognized quality assurance system that lets our domestic and international customers know they can count on the consistent quality of Simpson Strong-Tie® products and services.

800-999-5099 | www.strongtie.com

New Products

AT-XP® High-Strength Acrylic Adhesive

Formulated for high-strength anchorage of threaded rod and rebar into concrete (cracked or uncracked) and masonry under a wide range of conditions, AT-XP dispenses easily in cold or warm environments and, when mixed, is a dark teal color for easy identification.

See page 20 for more information.

Adhesive Piston Plug Delivery System

The Simpson Strong-Tie® Adhesive Piston Plug Delivery System facilitates consistent dispensing of anchoring adhesives in any installation orientation. The matched tolerance design between the piston plug and the drilled hole virtually eliminates the formation of voids and air pockets during adhesive dispensing.

See page 130 for more information.

Battery-Powered Dispensing Tool for Acrylic Adhesives

The ADTA30CKT offers power dispensing of 30 oz., 10:1-ratio, dual-cartridge adhesives without the need for a hose or compressor. Tool comes complete with two 18V lithium-ion battery packs and a charger.

See page 128 for more information.

Battery-Powered Dispensing Tool for Epoxy Adhesives

The EDTA22CKT offers power dispensing of 22 oz., 1:1-ratio, dual-cartridge adhesives without the need for a hose or compressor, and may be easily converted to dispense 16.5 oz., 2:1-ratio, dual-cartridge adhesives (conversion parts included). Tool comes complete with two 18V lithium-ion battery packs and a charger.

See page 128 for more information.

Titen HD® 1/4" Screw Anchor

The new 1/4" Titen HD Screw Anchor (THDB25) offers the same self-undercutting, non-expansion characteristics as the popular Titen HD anchor and is code listed for use in cracked and uncracked concrete.

See page 184 for more information.

New Products

Hollow Drop-In Anchor

The Simpson Strong-Tie® Hollow Drop-In Anchor (HDIA) is an internally threaded, flush-mount expansion anchor for use in hollow materials such as CMU and hollow-core plank, as well as in solid base materials.

See page 236 for more information.

Drop-In Internally Threaded Anchor (DIAB)

The redesigned drop-in internally threaded expansion shell anchors set easily by driving the expansion plug towards the bottom of the anchors using the specially designed SDS or hand-drive setting tool. A positive-set indicator shows when the plug is fully set and the anchor has properly expanded.

See page 224 for more information.

Heli-Tie™ Helical Stitching Tie

The Simpson Strong-Tie® helical stitching tie provides a unique solution for the preservation and repair of damaged brick and masonry structures. The stitching tie is grouted across the crack to reconnect and distribute the loads over a large surface area while providing an inconspicuous repair that preserves and maintains the appearance of the structure.

See page 292 for more information.

Wood Rod Hanger

The new wood rod hanger is a one-piece fastening system for suspending 1/4" or 3/8" threaded rod from wood members. Both vertical and horizontal rod hangers provide attachment points for use in pipe hanging, fire protection and cable-tray applications. The Type-17 point provides for fast starts with no pre-drilling required.

See page 212 for more information.

New Products

PT-27HDA

The PT-27HDA is a low-velocity, heavy-duty powder-actuated tool designed for installing fasteners into poured and precast concrete, grout-filled concrete masonry block, horizontal mortared joints and structural steel.

See page 260 for more information.

Tie-Wire Anchor

A wedge-style expansion anchor for use in normal-weight concrete or concrete over metal deck. Offers a tri-segmented, dual-embossed clip.

See page 177 for more information.

Crimp Drive® Countersunk

The Crimp Drive countersunk anchor is an easy-to-install expansion anchor for use in concrete and grout-filled CMU. The product design helps speed up anchor installation and reduce overall cost.

See page 242 for more information.

SDS Stop Bit

The fixed-depth drill bit – designed to meet the hole-depth specifications of most drop-in style anchors, including the DIA and DIAB series anchors – takes the guesswork out of drilling to correct depth, saving time and bit life.

See pages 225 or 303 for more information.

How to Use This Catalog

Using Data Tables and Load Tables

This catalog contains both strength design data tables and allowable load tables. Some allowable load tables for concrete were established under old qualification standards that are no longer valid under the IBC. The following icons indicate whether or not a given table is intended to be used under the IBC (or under other building codes that use the IBC as their basis):

Tables that are “not valid for International Building Code” may be used where the designer determines that other building codes or regulations permit it — for example, under AASTHO or temporary construction.

Strength Design Data Tables

Under the IBC, strength design (see page 322) must be used for cast-in-place and post-installed mechanical and adhesive anchors that are installed into concrete. The design data from these tables are to be used with the design provisions of ACI 318 Appendix D, IBC Chapter 19 and the respective ICC-ES Acceptance Criteria. Strength design data tables are watermarked with the letters “SD.” Given the complexity of strength design calculations, designers may find Simpson Strong-Tie® Anchor Designer™ software (www.strongtie.com/software) to be a great time saver for computing anchor design strengths using the tabulated design data.

Characteristic	Symbol	Units	Nominal Anchor Diameter (in.)								
			½	¾	1	1¼	1½	2	2½	3	
Steel Strength in Tension											
Minimum Tensile Stress Area	A_s	in ²	0.078	0.142	0.226	0.334	0.462	0.606	0.969

Tension Resistance of Steel — Type 410 Stainless (ASTM A193, Grade B8)	N_{st}	lb	8,580	15,620	24,860	36,740	50,820	68,050	106,590		
Tension Resistance of Steel — Type 304 and 316 Stainless (ASTM A193, Grade B8 & B8M)			4,445	8,095	12,880	19,040	26,335	34,540	55,235		
Strength Reduction Factor — Steel Failure	ϕ	—						0.75 ²			
Concrete Breakout Strength in Tension (2,500 psi ≤ f_c ≤ 8,000 psi)²											
Effectiveness Factor — Uncracked Concrete	k_{ucr}	—					24				
Effectiveness Factor — Cracked Concrete	k_{cr}	—					17				
Strength Reduction Factor — Breakout Failure	ϕ	—					0.65 ³				
Bond Strength in Tension (2,500 psi ≤ f_c ≤ 8,000 psi)²											
Uncracked Concrete ^{1,4}	Characteristic Bond Strength ^{1,11}	τ_{uc}	psi	770	1,150	1,000	970	885	790	620	
	Permitted Embedment Depth Range	Minimum	in	2 ¾	2 ¾	3 ¾	3 ¾	3 ¾	4	5	
Cracked Concrete ^{1,4}	Characteristic Bond Strength ^{1,11, 14}	τ_{cr}	psi	715	10	12 ½	15	17 ½	20	25	
	Permitted Embedment Depth Range	Minimum	in	3	4	5	6	7	8	10	

Example Strength Design Data Table

Allowable Load Tables

Under the IBC, allowable stress design (see page 322) maybe used for cast-in-place and post-installed adhesive and mechanical anchors installed into masonry or for gas/powder-actuated fasteners installed into concrete, masonry or steel.

Diameter (in.) or Rebar Size No.	Drill Bit Diameter (in.)	Minimum Embedment ¹ (in.)	Allowable Load Based on Bond Strength ¹ (lb.)		
			Tension Load	Shear Perp.	Shear Parallel
Threaded Rod Installed in the Top of CMU Wall					
½	¾	4 ½	1,485	500	1,050
		12	2,440	665	1,625
¾	¾	5 ½	1,700	565	1,435
		15	2,660	680	1,785
1	¾	6 ½	1,610	735	1,370
		21	4,760	670	1,375
Rebar Installed in the Top of CMU Wall					
#4	¾	4 ½	1,265	550	865
		12	2,715	465	1,290
#5	¾	5 ½	1,245	590	1,140
		15	3,090	590	1,285

1. Allowable load shall be the lesser of the bond values shown in this table and steel values, shown on page XX.
 2. Allowable loads are for installation in the grouted CMU core opening.
 3. Embedment depth shall be measured from the horizontal surface of the grouted CMU core opening on top of the masonry wall.

Example Allowable Load Table

Important Information and General Notes

Under the IBC, allowable stress design may only be used for cast-in-place and post-installed mechanical and adhesive anchors installed into concrete if the allowable loads are converted from strength design calculations. Converted allowable loads are very specific to the design assumptions described in the tables.

SET-XP® Allowable Tension Loads for Threaded Rod Anchors in Normal-Weight Concrete ($f'_c = 2,500$ psi) – Static Load

Rod Dia. (in.)	Nominal Embed. Depth (in.)	Minimum Dimensions for Uncracked (in.)		Minimum Dimensions for Cracked (in.)		Allowable Tension Load Based on Concrete or Bond (lb.)

Example Converted Allowable Load Table

Table Icon System

In order to facilitate easier identification of performance data, the following icon system has been incorporated into the sections of the catalog with multiple load tables. These icons will appear in the heading of the table to promote easier visual identification of the type of load, insert type and substrate addressed in the table. Icons are intended for quick identification. All specific information regarding suitability should be read from the table itself.

Important Information and General Notes

General Notes

These general notes are provided to ensure proper installation of Simpson Strong-Tie Company Inc. products and must be followed fully.

- Simpson Strong-Tie Company Inc. reserves the right to change specifications, designs, and models without notice or liability for such changes.
- Unless otherwise noted, dimensions are in inches and loads are in pounds.
- Do not overload, which will jeopardize the anchorage. Service loads shall not exceed published allowable loads. Factored loads shall not exceed design strengths calculated in accordance with published design data.
- Some hardened fasteners may experience premature failure if exposed to moisture. These fasteners are recommended to be used in dry interior applications.
- Do not weld products listed in this catalog. Some steel types have poor weldability and a tendency to crack when welded.

General Instructions for the Installer

These general instructions for the installer are provided to ensure the proper selection and installation of Simpson Strong-Tie products and must be followed carefully. They are in addition to the specific design and installation instructions and notes provided for each particular product, all of which should be consulted prior to and during the installation of Simpson Strong-Tie products.

- Do not modify Simpson Strong-Tie products as the performance of modified products may be substantially weakened. Simpson Strong-Tie will not warrant or guarantee the performance of such modified products.
- Do not alter installation procedures from those set forth in this catalog.
- Drill holes for post-installed anchors with carbide-tipped drills meeting the diameter requirements of ANSI B212.15 (shown in the table to the right). A properly sized hole is critical to the performance of post-installed anchors. Rotary-hammered drills with light, high-frequency impact are recommended for drilling holes. When holes are to be drilled in archaic or hollow base materials, the drill should be set to "rotation only" mode.
- For mechanical anchors requiring specific installation torque: Failure to apply the recommended installation torque can result in excessive displacement of the anchor under load or premature failure of the anchor. These anchors will lose pre-tension after setting due to pre-load relaxation. See page 316 for more information.
- Do not disturb, bolt up, or apply load to adhesive anchors prior to the full cure of the adhesive.
- Use proper safety equipment.

Finished Diameters for Rotary and Rotary-Hammer Carbide-Tipped Concrete Drills per ANSI B212.15

Nominal Drill Bit Diameter (in.)	Tolerance Range Minimum (in.)	Tolerance Range Maximum (in.)
1/8	0.134	0.140
9/32	0.165	0.171
3/16	0.198	0.206
7/32	0.229	0.237
1/4	0.260	0.268
5/16	0.327	0.335
3/8	0.390	0.398
7/16	0.458	0.468
1/2	0.520	0.530
9/16	0.582	0.592
5/8	0.650	0.660
11/16	0.713	0.723
3/4	0.775	0.787
13/16	0.837	0.849
27/32	0.869	0.881
7/8	0.905	0.917
15/16	0.968	0.980
1	1.030	1.042
1 1/8	1.160	1.175
1 1/16	1.223	1.238
1 1/4	1.285	1.300
1 5/16	1.352	1.367
1 3/8	1.410	1.425
1 7/16	1.472	1.487
1 1/2	1.535	1.550
1 9/16	1.588	1.608
1 5/8	1.655	1.675
1 3/4	1.772	1.792
2	2.008	2.028

Important Information and General Notes

Additional Instructions for the Installer for Gas- and Powder-Actuated Fastening

Before operating any Simpson Strong-Tie gas- or powder-actuated tool, you must read and understand the Operator's Manual and be trained by an authorized instructor in the operation of the tool. Simpson Strong-Tie recommends you read and fully understand the safety guidelines of the tool you use. To become a Certified Operator of Simpson Strong-Tie gas- and powder-actuated tools, you must pass a test and receive a certified operator card. Test and Operator's Manual are included with each tool kit. Extra copies may be obtained by contacting Simpson Strong-Tie at (800) 999-5099.

To avoid serious injury or death:

- a. Always make sure that the operators and bystanders wear safety glasses. Hearing and head protection is also recommended.
- b. Always post warning signs within the area when gas- or powder-actuated tools are in use. Signs should state "Tool in Use."
- c. Always store gas- and powder-actuated tools unloaded. Store tools and powder loads in a locked container out of reach of children.
- d. Never place any part of your body over the front muzzle of the tool, even if no fastener is present. The fastener, pin or tool piston can cause serious injury or death in the event of accidental discharge.
- e. Never attempt to bypass or circumvent any of the safety features on a gas- or powder-actuated tool.
- f. Always keep the tool pointed in a safe direction.
- g. Always keep your finger off the trigger.
- h. Always keep the tool unloaded until ready to use.
- i. Always hold the tool perpendicular (90°) to the fastening surface to prevent ricocheting fasteners. Use the spall guard whenever possible.
- j. Never attempt to fasten into soft, thin, brittle or very hard materials such as drywall, light-gauge steel, glass, tile or cast iron as these materials are inappropriate. Conduct a pre-punch test to determine base material adequacy.
- k. Never attempt to fasten into soft material such as drywall or wood. Fastening through soft materials into appropriate base material may be allowed if the application is appropriate.
- l. Never attempt to fasten to a spalled, cracked or uneven surface.

Important Information and General Notes

General Instructions for the Designer

These general instructions for the designer are provided to ensure the proper selection and installation of Simpson Strong-Tie® products and must be followed carefully. They are in addition to the specific design and installation instructions and notes provided for each particular product, all of which should be consulted prior to and during the design process.

- a. The term “Designer” used throughout this catalog is intended to mean a licensed/certified building design professional, a licensed professional engineer or a licensed architect.
 - b. All connected members and related elements shall be designed by the Designer and must have sufficient strength (bending, shear, etc.) to resist the loads imposed by the anchors.
 - c. When the allowable stress design method is used, the design service load shall not exceed the published allowable loads reduced by load-adjustment factors for temperature, spacing and edge distance. Where stated in this catalog, allowable loads may be increased 33⅓% when permitted by code. In general, this is permissible only when the alternative basic load combinations of the IBC are used.
 - d. When the strength design method is used, the factored loads shall not exceed the design strengths calculated in accordance with the published design data.
 - e. Simpson Strong-Tie strongly recommends the following addition to construction drawings and specifications: “Simpson Strong-Tie products are specifically required to meet the structural calculations of plan. Before substituting another brand, confirm load capacity based on reliable published testing data or calculations. The Engineer/Designer should evaluate and give written approval for substitution prior to installation.”
 - f. Where used in this catalog, “IBC” refers to the 2012 International Building Code, and “ACI 318” refers to ACI 318-11 Building Code Requirements for Structural Concrete. Local and/or regional building codes may require meeting special conditions. Building codes often require special inspection of anchors. For compliance with these requirements, contact the local building authority. Except where mandated by code, Simpson Strong-Tie products do not require special inspection.
 - g. Allowable loads and design strengths are determined from test results, calculations and experience. These are guide values for sound base materials with known properties. Due to variation in base materials and site conditions, site-specific testing should be conducted if exact performance in a specific base material at a specific site must be known.
 - h. Unless stated otherwise, tests conducted to derive performance information were performed in members with minimum thickness equal to 1.5 times the anchor embedment depth. Anchoring into thinner members requires the evaluation and judgment of a qualified Designer.
 - i. Tests are conducted with anchors installed perpendicular ($\pm 6^\circ$ from a vertical reference) from a vertical reference to the surface of the base material. Deviations can result in anchor bending stresses and reduce the load-carrying capacity of the anchor.
 - j. Allowable loads and design strengths do not consider bending stresses due to shear loads applied with large eccentricities.
 - k. Metal anchors and fasteners will corrode and may lose load-carrying capacity when installed in corrosive environments or exposed to corrosive materials. See page 316.
 - l. Mechanical anchors should not be installed into concrete that is less than 7 days old. The allowable loads and design strengths of mechanical anchors that are installed into concrete less than 28 days old should be based on the actual compressive strength of the concrete at the time of installation.
 - m. Nominal embedment depth (“embedment depth”) is the distance from the surface of the base material to the installed end of the anchor and is measured prior to application of an installation torque (if applicable). Effective embedment depth is the distance from the surface of the base material to the deepest point at which the load is transferred to the base material.
 - n. Drill bits shall meet the diameter requirements of ANSI B212.15. For adhesive anchor installations in oversized holes, see page 318. For adhesive anchor installations into core-drilled holes, see page 319.
 - o. Threaded-rod inserts for adhesive anchors shall be oil-free UNC fully threaded steel. Bare steel, zinc plating, mechanical galvanizing or hot-dip galvanizing coatings are acceptable.
 - p. Allowable loads and design strengths are generally based on testing of adhesive anchors installed into dry holes. For installations into damp, wet and submerged environments, see page 319.
- ACI 318 states that adhesive anchors should not be installed into concrete that is less than 21 days old. For information on adhesive anchors installed into concrete less than 21 days old, see page 318.
- q. Adhesive anchors can be affected by elevated base material temperature. See page 319.
 - r. Anchors are permitted to support fire-resistant construction provided at least one of the following conditions is fulfilled: (a) anchors are used to resist wind or seismic forces only; (b) anchors that support gravity-load-bearing structural elements are within a fire-resistive envelope or a fire-resistive membrane, are protected by approved fire-resistive materials, or have been evaluated for resistance to fire exposure in accordance with recognized standards; or (c) anchors are used to support non-structural elements.
 - s. Exposure to some chemicals may degrade the bond strength of adhesive anchors. Refer to the product description for chemical resistance information or refer to see page 320.

Important Information and General Notes

Limited Warranty

Simpson Strong-Tie Company Inc. warrants catalog products to be free from defects in material or manufacturing. Simpson Strong-Tie Company Inc. products are further warranted for adequacy of design when used in accordance with design limits in this catalog and when properly specified, installed and maintained. This warranty does not apply to uses not in compliance with specific applications and installations set forth in this catalog, or to non-catalog or modified products, or to deterioration due to environmental conditions.

Simpson Strong-Tie® anchors, fasteners and connectors are designed to enable structures to resist the movement, stress and loading that results from impact events such as earthquakes and high-velocity winds. Other Simpson Strong-Tie products are designed to the load capacities and uses listed in this catalog. Properly installed Simpson Strong-Tie products will perform in accordance with the specifications set forth in the applicable Simpson Strong-Tie catalog. Additional performance limitations for specific products may be listed on the applicable catalog pages.

Due to the particular characteristics of potential impact events, the specific design and location of the structure, the building

materials used, the quality of construction, and the condition of the soils involved, damage may nonetheless result to a structure and its contents even if the loads resulting from the impact event do not exceed Simpson Strong-Tie catalog specifications and Simpson Strong-Tie connectors are properly installed in accordance with applicable building codes.

All warranty obligations of Simpson Strong-Tie Company Inc. shall be limited, at the discretion of Simpson Strong-Tie Company Inc., to repair or replacement of the defective part. These remedies shall constitute the sole obligation of Simpson Strong-Tie Company Inc. and the sole remedy of purchaser under this warranty. In no event will Simpson Strong-Tie Company Inc. be responsible for incidental, consequential, or special loss or damage, however caused.

This warranty is expressly in lieu of all other warranties, expressed or implied, including warranties of merchantability or fitness for a particular purpose, all such other warranties being hereby expressly excluded. This warranty may change periodically – consult our website www.strongtie.com for current information.

Terms and Conditions of Sale

Product Use

Products in this catalog are designed and manufactured for the specific purposes shown, and should not be used with other connectors not approved by a qualified Designer. Modifications to products or changes in installations should only be made by a qualified Designer. The performance of such modified products or altered installations is the sole responsibility of the Designer.

Indemnity

Customers or Designers modifying products or installations, or designing non-catalog products for fabrication by Simpson Strong-Tie Company Inc. shall, regardless of specific instructions to the user, indemnify, defend and hold harmless Simpson Strong-Tie Company Inc. for any and all claimed loss or damage occasioned in whole or in part by non-catalog or modified products.

Non-Catalog And Modified Products

Consult Simpson Strong-Tie Company Inc. for applications for which there is no catalog product, or for connectors for use in hostile environments, with excessive wood shrinkage, or with abnormal loading or erection requirements.

Non-catalog products must be designed by the customer and will be fabricated by Simpson Strong-Tie in accordance with customer specifications.

Simpson Strong-Tie cannot and does not make any representations regarding the suitability of use or load-carrying capacities of non-catalog products. Simpson Strong-Tie provides no warranty, express or implied, on non-catalog products. F.O.B. Shipping Point unless otherwise specified.

Important Information and General Notes

Warning

Simpson Strong-Tie Company Inc. anchors, fasteners and connectors are designed and tested to provide specified design loads. To obtain optimal performance from Simpson Strong-Tie products and to achieve maximum allowable design load, the products must be properly installed and used in accordance with the installation instructions and design limits provided by Simpson Strong-Tie. To ensure proper installation and use, designers and installers must carefully read the General Notes, General Instructions to the Installer and General Instructions to the Designer contained in this catalog, as well as consult the applicable catalog pages for specific product installation instructions and notes. Please always consult the Simpson Strong-Tie website at strongtie.com for updates regarding all Simpson Strong-Tie products.

Proper product installation requires careful attention to all notes and instructions, including the following basic rules:

1. Be familiar with the application and correct use of the anchor, connector or fastener.
2. Follow all installation instructions provided in the catalog, website, *Installer's Pocket Guide* or any other Simpson Strong-Tie publication.
3. Follow all product-related warnings provided in the catalog, website or any other Simpson Strong-Tie publication.
4. Install anchors, connectors and fasteners in accordance with their intended use.
5. Install all anchors, connectors and fasteners per installation instructions provided by Simpson Strong-Tie.
6. When using power tools to install fasteners:
 - (a) use proper fastener type for direct fastening tool; (b) use proper powder or gas loads; and (c) follow appropriate safety precautions as outlined in this catalog, on the website or in the tool Operator's Manual.

In addition to following the basic rules provided above as well as all notes, warnings and instructions provided in the catalog, installers, designers, engineers and consumers should consult the Simpson Strong-Tie website at www.strongtie.com to obtain additional design and installation information, including:

- Instructional builder/contractor training kits containing an instructional video, an instructor guide and a student guide in both English and Spanish;
- *Installer's Pocket Guide* (form S-INSTALL; contact Simpson Strong-Tie for more information), which is designed specifically for installers and uses detailed graphics and minimal text in both English and Spanish to explain visually how to install many key products;

- Information on workshops Simpson Strong-Tie conducts at various training centers throughout the United States;
- Product-specific installation videos;
- Specialty catalogs;
- Code reports – Simpson Strong-Tie® Code Report Finder software;
- Technical fliers, bulletins and engineering letters;
- Master format specifications;
- Material safety data sheets;
- Corrosion information;
- Adhesive cartridge estimator;
- Simpson Strong-Tie Anchor Designer™ software;
- Simpson Strong-Tie AutoCAD® menu;
- Simpson Strong-Tie CFS Designer™ software;
- Simpson Strong-Tie Connector Selector™ software;
- Connector selection guides for engineered wood products (by manufacturer);
- Simpson Strong-Tie Strong-Wall® Selector software;
- Simpson Strong-Tie Strong Frame® Selector;
- Simpson Strong-Tie Fastener Finder; and
- Answers to frequently asked questions and technical topics.

Failure to fully follow all of the notes and instructions provided by Simpson Strong-Tie may result in improper installation of products. Improperly installed products may not perform to the specifications set forth in this catalog and may reduce a structure's ability to resist the movement, stress and loading that occur from gravity loads as well as impact events such as earthquakes and high-velocity winds.

Simpson Strong-Tie Company Inc. does not guarantee the performance or safety of products that are modified, improperly installed or not used in accordance with the design and load limits set forth in this catalog.

Adhesive Anchors

From rebar doweling on a high-traffic infrastructure retrofit project to do-it-yourself projects, Simpson Strong-Tie offers a wide variety of adhesive anchoring products to meet virtually any need.

Our strong, versatile epoxy-based adhesives are ideal for anchoring threaded rod, rebar and smooth dowels in an assortment of base materials. And our acrylic formulations deliver consistent performance for high-strength anchor grouting in a wide range of weather conditions — curing fast even in water-saturated concrete.

AT-XP® High-Strength Acrylic Adhesive

Formulated for high-strength anchorage of threaded rod and rebar into cracked and uncracked concrete and masonry under a wide range of conditions, AT-XP® adhesive dispenses easily in cold or warm environments and in below-freezing temperatures with no need to warm the cartridge. When mixed properly, this low-odor formula is a dark teal color for easy post-installation identification.

Features

- Passed the demanding ICC-ES AC308 adverse-condition tests pertaining to reduced and elevated temperatures and long-term sustained loads
- Code listed under the IBC/IRC for cracked and uncracked concrete per IAPMO UES ER-263 and City of L.A. RR25960
- Code listed under the IBC/IRC for masonry per IAPMO UES ER-281 and City of L.A. RR25966
- 10:1 two-component high-strength, acrylic-based anchoring adhesive
- Suitable for use under static and seismic loading conditions in cracked and uncracked concrete as well as masonry
- Easy hole-cleaning procedure – no power-brushing required
- Suitable for use in dry or water-saturated concrete
- For best results, store between 14°F and 80°F
- Cures in substrate temperatures as low as 14°F (-10°C) in 24 hours or less
- Available in 9.4 oz., 12.5 oz. and 30 oz. cartridges for application versatility
- Volatile Organic Compound (VOC) – 30 g/L
- Manufactured in the USA using global materials

Applications

- Threaded rod anchoring and rebar doweling into concrete and masonry
- Suitable for horizontal, vertical and overhead applications

Codes: IAPMO UES ER-263 (concrete); IAPMO UES ER-281 (masonry); City of L.A. RR25960 (concrete), RR25966 (masonry); FL-16230.1; NSF/ANSI Standard 61 (43.2 in.²/1,000 gal.)

Chemical Resistance

See pages 320–321.

Installation and Application Instructions

(See also pages 124–127.)

- Surfaces to receive adhesive must be clean.
- Base material temperature must be 14°F or above at the time of installation. For best results, material should be 14–80°F at time of application.
- To warm cold material, store cartridges in a warm, uniformly heated area or storage container. Do not immerse cartridges in water to facilitate warming.
- Mixed material in nozzle can harden in 3–4 minutes at temperatures of 70°F and above.

AT-XP® Adhesive

Design Example

See page 328.

Suggested Specifications

See www.strongtie.com for more information.

AT-XP® High-Strength Acrylic Adhesive

AT-XP® Adhesive Cartridge System

Model No.	Capacity ounces (cubic in.)	Cartridge Type	Carton Qty.	Dispensing Tool	Mixing Nozzle
AT-XP10	9.4 (16.9)	Coaxial	6	CDT10S	AMN19Q
AT-XP13	12.5 (22.5)	Side-by-side	10	ADT813S	
AT-XP30	30 (54)	Side-by-side	5	ADT30S ADTA30P or ADTA30CKT	

1. Cartridge estimation guidelines are available at www.strongtie.com/apps.
2. Detailed information on dispensing tools, mixing nozzles and other adhesive accessories is available on pages 128 through 135 or at www.strongtie.com.
3. Use only Simpson Strong-Tie® mixing nozzles in accordance with Simpson Strong-Tie instructions. Modification or improper use of mixing nozzle may impair AT-XP adhesive performance.
4. One AMN19Q mixing nozzle and one nozzle extension are supplied with each cartridge.

Cure Schedule

Base Material Temperature		Cure Time (hrs.)
°F	°C	
14	-10	24
32	0	8
50	10	3
68	20	1
86	30	30 min.
100	38	20 min.

For water-saturated concrete, the cure times must be doubled.

AT-XP® Design Information — Concrete

AT-XP® Installation Information and Additional Data for Threaded Rod and Rebar in Normal-Weight Concrete¹

Characteristic	Symbol	Units	Nominal Anchor Diameter (in.) / Rebar Size							
			3/8 / #3	1/2 / #4	5/8 / #5	3/4 / #6	7/8 / #7	1 / #8	1 1/4 / #10	
Installation Information										
Drill Bit Diameter for Threaded Rod	d_{hole}	in.	7/16	9/16	1 1/16	1 3/16	1	1 1/8	1 3/8	
Drill Bit Diameter for Rebar	d_{hole}	in.	1/2	5/8	3/4	7/8	1	1 1/8	1 3/8	
Maximum Tightening Torque	T_{inst}	ft.-lb.	10	20	30	45	60	80	125	
Permitted Embedment Depth Range ²	Minimum	h_{ef}	in.	2 3/8	2 3/4	3 1/8	3 1/2	3 3/4	4	5
	Maximum	h_{ef}	in.	7 1/2	10	12 1/2	15	17 1/2	20	25
Minimum Concrete Thickness	h_{min}	in.	$h_{ef} + 5d_o$							
Critical Edge Distance ²	c_{ac}	in.	See footnote 2							
Minimum Edge Distance	c_{min}	in.	1 3/4						2 3/4	
Minimum Anchor Spacing	s_{min}	in.	3						6	

1. The information presented in this table is to be used in conjunction with the design criteria of ACI 318-11.

2. $c_{ac} = h_{ef} (\tau_{k,uncr} / 1160)^{0.4} \times [3.1 - 0.7(h/h_{ef})]$, where:

$$[h/h_{ef}] \leq 2.4$$

$\tau_{k,uncr}$ = the characteristic bond strength in uncracked concrete, given in the tables that follow $\leq k_{uncr} ((h_{ef} \times f'_c)^{0.5} / (\pi \times d_a))$

h = the member thickness (inches)

h_{ef} = the embedment depth (inches)

* See page 12 for an explanation of the load table icons.

AT-XP® Design Information — Concrete

AT-XP® Tension Strength Design Data for Threaded Rod in Normal-Weight Concrete¹

Characteristic		Symbol	Units	Nominal Anchor Diameter (in.)						
				3/8	1/2	5/8	3/4	7/8	1	1 1/4

Bond Strength in Tension — Bond Strength Reduction Factors for Continuous Special Inspection										
Strength Reduction Factor — Dry Concrete		ϕ_{dry}	—	0.65 ⁷						
Strength Reduction Factor — Water-Saturated Concrete		ϕ_{sat}	—	0.45 ⁷						
Additional Factor for Water-Saturated Concrete		K_{sat}	—	0.54 ⁵			0.77 ⁵		0.96 ⁵	
Bond Strength in Tension — Bond Strength Reduction Factors for Periodic Special Inspection										
Strength Reduction Factor — Dry Concrete		ϕ_{dry}	—	0.55 ⁷						
Strength Reduction Factor — Water-Saturated Concrete		ϕ_{sat}	—	0.45 ⁷						
Additional Factor for Water-Saturated Concrete		K_{sat}	—	0.46 ⁵			0.65 ⁵		0.81 ⁵	

- The information presented in this table is to be used in conjunction with the design criteria of ACI 318-11.
- Temperature Range: Maximum short-term temperature of 180°F. Maximum long-term temperature of 110°F.
- Short-term concrete temperatures are those that occur over short intervals (diurnal cycling).
- Long-term concrete temperatures are constant temperatures over a significant time period.
- In water-saturated concrete, multiply $\tau_{k,uncr}$ and $\tau_{k,cr}$ by K_{sat} .
- The value of ϕ applies when the load combinations of ACI 318 Section 9.2 are used. If the load combinations of ACI 318 Appendix C are used, refer to Section D.4.4 to determine the appropriate value of ϕ .
- The value of ϕ applies when both the load combinations of ACI 318 Section 9.2 are used and the requirements of Section D.4.3 (c) for Condition B are met. If the load combinations of ACI 318 Appendix C are used, refer to Section D.4.4 to determine the appropriate value of ϕ .
- The value of ϕ applies when both the load combinations of ACI 318 Section 9.2 are used and the requirements of Section D.4.3 (c) for Condition B are met. If the load combinations of ACI 318 Appendix C are used, refer to Section D.4.4 to determine the appropriate value of ϕ .
- The value of ϕ applies when both the load combinations of ACI 318 Section 9.2 are used and the requirements of Section D.4.3 (c) for Condition B are met. If the load combinations of ACI 318 Appendix C are used, refer to Section D.4.4 to determine the appropriate value of ϕ .
- For anchors installed in regions assigned to Seismic Design Category C, D, E or F, the bond strength values for 1/2", 3/8", 3/4" and 1" anchors must be multiplied by $\alpha_{N,seis} = 0.85$.
- For anchors installed in regions assigned to Seismic Design Category C, D, E or F, the bond strength values for 1 1/4" anchors must be multiplied by $\alpha_{N,seis} = 0.75$.
- For anchors installed in regions assigned to Seismic Design Category C, D, E or F, the bond strength values for 7/8" anchors must be multiplied by $\alpha_{N,seis} = 0.59$.

AT-XP® Design Information — Concrete

AT-XP® Tension Strength Design Data for Rebar in Normal-Weight Concrete¹

Adhesive Anchors

Characteristic		Symbol	Units	Rebar Size							
				#3	#4	#5	#6	#7	#8	#10	
Steel Strength in Tension											
Rebar	Minimum Tensile Stress Area	A_{se}	in. ²	0.11	0.2	0.31	0.44	0.6	0.79	1.27	
	Tension Resistance of Steel — Rebar (ASTM A615 Grade 60)	N_{sa}	lb.	9,900	18,000	27,900	39,600	54,000	71,100	114,300	
	Tension Resistance of Steel — Rebar (ASTM A706 Grade 60)			8,800	16,000	24,800	35,200	48,000	63,200	101,600	
	Strength Reduction Factor — Steel Failure	ϕ	—	0.75 ⁶							
Concrete Breakout Strength in Tension (2,500 psi ≤ f'_c ≤ 8,000 psi)											
Effectiveness Factor — Uncracked Concrete		k_{uncr}	—	24							
Effectiveness Factor — Cracked Concrete		k_{cr}	—	17							
Strength Reduction Factor — Breakout Failure		ϕ	—	0.65 ⁸							
Bond Strength in Tension (2,500 psi ≤ f'_c ≤ 8,000 psi)											
Uncracked Concrete ^{2,3,4}	Characteristic Bond Strength		$\tau_{k,uncr}$	psi	1,010	990	970	955	935	915	875
	Permitted Embedment Depth Range	Minimum	h_{ef}	in.	2 ³ / ₈	2 ³ / ₄	3 ¹ / ₈	3 ¹ / ₂	3 ³ / ₄	4	5
		Maximum			7 ¹ / ₂	10	12 ¹ / ₂	15	17 ¹ / ₂	20	25
Cracked Concrete ^{2,3,4}	Characteristic Bond Strength		$\tau_{k,cr}$	psi	340	770	780	790	795	795	820
	Permitted Embedment Depth Range	Minimum	h_{ef}	in.	3	3	3 ¹ / ₈	3 ¹ / ₂	3 ³ / ₄	4	5
		Maximum			7 ¹ / ₂	10	12 ¹ / ₂	15	17 ¹ / ₂	20	25
Bond Strength in Tension — Bond Strength Reduction Factors for Continuous Special Inspection											
Strength Reduction Factor — Dry Concrete		ϕ_{dry}	—	0.65 ⁷					0.55 ⁷		
Strength Reduction Factor — Water-Saturated Concrete		ϕ_{sat}	—	0.45 ⁷							
Additional Factor for Water-Saturated Concrete		K_{sat}	—	0.54 ⁵		0.77 ⁵			0.96 ⁵		
Bond Strength in Tension — Bond Strength Reduction Factors for Periodic Special Inspection											
Strength Reduction Factor — Dry Concrete		ϕ_{dry}	—	0.55 ⁷					0.45 ⁷		
Strength Reduction Factor — Water-Saturated Concrete		ϕ_{sat}	—	0.45 ⁷							
Additional Factor for Water-Saturated Concrete		K_{sat}	—	0.46 ⁵		0.65 ⁵			0.81 ⁵		

- The information presented in this table is to be used in conjunction with the design criteria of ACI 318-11.
- Temperature Range: Maximum short-term temperature of 180°F. Maximum long-term temperature of 110°F.
- Short-term concrete temperatures are those that occur over short intervals (diurnal cycling).
- Long-term concrete temperatures are constant temperatures over a significant time period.
- In water-saturated concrete, multiply $\tau_{k,uncr}$ and $\tau_{k,cr}$ by K_{sat} .
- The value of ϕ applies when the load combinations of ACI 318 Section 9.2 are used. If the load combinations of ACI 318 Appendix C are used, refer to Section D.4.4 to determine the appropriate value of ϕ .

- The value of ϕ applies when both the load combinations of ACI 318 Section 9.2 are used and the requirements of Section D.4.3 (c) for Condition B are met. If the load combinations of ACI 318 Appendix C are used, refer to Section D.4.4 to determine the appropriate value of ϕ .
- The value of ϕ applies when both the load combinations of ACI 318 Section 9.2 are used and the requirements of Section D.4.3 (c) for Condition B are met. If the load combinations of ACI 318 Section 9.2 are used and the requirements of Section D.4.3 (c) for Condition A are met, refer to Section D.4.3 to determine the appropriate value of ϕ . If the load combinations of ACI 318 Appendix C are used, refer to Section D.4.4 to determine the appropriate value of ϕ .

* See page 12 for an explanation of the load table icons.

Outside Diameter of Anchor	d_o	in.	0.375	0.5	0.625	0.75	0.875	1	1.25	
Load-Bearing Length of Anchor in Shear	ℓ_e	in.	h_{eff}							
Strength Reduction Factor — Breakout Failure	ϕ	—	0.70 ³							
Concrete Pryout Strength in Shear										
Coefficient for Pryout Strength	k_{cp}	—	1.0 for $h_{eff} < 2.50"$; 2.0 for $h_{eff} \geq 2.50"$							
Strength Reduction Factor — Pryout Failure	ϕ	—	0.70 ⁴							

1. The information presented in this table is to be used in conjunction with the design criteria of ACI 318-11.

2. The value of ϕ applies when the load combinations of ACI 318 Section 9.2 are used. If the load combinations of ACI 318 Appendix C are used, refer to Section D.4.4 to determine the appropriate value of ϕ .

3. The value of ϕ applies when both the load combinations of ACI 318 Section 9.2 are used and the requirements of Section D.4.3 (c) for Condition B are met. If the load combinations of ACI 318 Section 9.2 are used and the requirements of Section D.4.3 (c) for Condition A are met, refer to Section D.4.3 to determine the appropriate value of ϕ . If the load combinations of ACI 318 Appendix C are used, refer to Section D.4.4 to determine the appropriate value of ϕ .

4. The value of ϕ applies when both the load combinations of ACI 318 Section 9.2 are used and the requirements of Section D.4.3 (c) for Condition B are met. If the load combinations of ACI 318 Appendix C are used, refer to Section D.4.4 to determine the appropriate value of ϕ .

5. The values of V_{sa} are applicable for both cracked concrete and uncracked concrete. For anchors installed in regions assigned to Seismic Design Category C, D, E or F, V_{sa} must be multiplied by $\alpha_{V,seis}$ for the corresponding anchor steel type.

1 1/4	42,150	54,505	90,845	79,945	90,845	41,425

- Tension design strength must be the lesser of the concrete, bond or threaded rod steel design strength.
- Tension design strengths are based on the strength design provisions of ACI 318-11 Appendix D assuming dry concrete, periodic inspection, short-term temperature of 180°F and long-term temperature of 110°F.
- Tabulated values are for a single anchor with no influence of another anchor.
- Interpolation between embedment depths is not permitted.
- Strength reduction factor, ϕ , is based on using a load combination from ACI 318-11 Section 9.2.
- The tension design strength listed for SDC (Seismic Design Category) A-B may also be used in SDC C-F when the tension component of the strength-level seismic design load on the anchor does not exceed 20% of the total factored tension load on the anchor associated with the same load combination.
- When designing anchorages in SDC C-F, the Designer shall consider the ductility requirements of ACI 318-11 Section D.3.3. Design strengths in **Bold** indicate that the anchor ductility requirements of D.3.3.4.3 (a)1 to 3 are satisfied when using ASTM F1554 Grade 36 threaded rod. Any other ductility requirements must be satisfied.
- Tension design strengths in SDC C-F have been adjusted by 0.75 factor in accordance with ACI 318-11 Section D.3.3.4.4.

* See page 12 for an explanation of the load table icons.

1 1/4	30,105	38,930	64,890	57,105	64,890	29,590

1. Allowable tension load must be the lesser of the concrete, bond or threaded rod steel load.
2. Allowable tension loads are calculated based on the strength design provisions of ACI 318-11 Appendix D assuming dry concrete, periodic inspection, short-term temperature of 180°F and long-term temperature of 110°F. Tension design strengths are converted to allowable tension loads using a conversion factor of $\alpha = 1.4$. The conversion factor α is based on the load combination 1.2D + 1.6L assuming 50% dead load and 50% live load: $1.2(0.5) + 1.6(0.5) = 1.4$.
3. Tabulated values are for a single anchor with no influence of another anchor.
4. Interpolation between embedment depths is not permitted.

* See page 12 for an explanation of the load table icons.

7/8	14,065	18,195	30,320	26,680	30,320	13,825
1	18,455	23,865	39,770	34,995	39,770	18,135
1 1/4	29,505	38,155	63,590	55,960	63,590	29,000

- Allowable tension load must be the lesser of the concrete, bond or threaded rod steel load.
- Allowable tension loads are calculated based on the strength design provisions of ACI 318-11 Appendix D assuming dry concrete, periodic inspection, short-term temperature of 180°F and long-term temperature of 110°F. Tension design strengths are converted to allowable tension loads using a conversion factor of $\alpha = 1/1.43$. The conversion factor α is based on the load combination assuming 100% seismic load.
- Tabulated values are for a single anchor with no influence of another anchor.
- Interpolation between embedment depths is not permitted.
- The allowable tension load listed for SDC (Seismic Design Category) A-B may also be used in SDC C-F when the tension component of the strength-level seismic design load on the anchor does not exceed 20% of the total factored tension load on the anchor associated with the same load combination.
- When designing anchorages in SDC C-F, the Designer shall consider the ductility requirements of ACI 318-11 Section D.3.3. Design strengths in **Bold** indicate that the anchor ductility requirements of D.3.3.4.3 (a)1 to 3 are satisfied when using ASTM F1554 Grade 36 threaded rod. Any other ductility requirements must be satisfied.
- Allowable tension loads in SDC C-F have been adjusted by 0.75 factor in accordance with ACI 318-11 Section D.3.3.4.4.

* See page 12 for an explanation of the load table icons.

Adhesive Anchors

C-A-2016 © 2015 SIMPSON STRONG-TIE COMPANY INC.

Rebar Size	Tension Design Strength of Rebar Steel (lb.)	
	ASTM A615 GR 60	ASTM A706 GR 60
#3	6,435	5,720
#4	11,700	10,400
#5	18,135	16,120
#6	25,740	22,880
#7	35,100	31,200
#8	46,215	41,080
#10	74,100	66,040

1. Tension design strength must be the lesser of the concrete, bond or rebar steel design strength.
2. Tension design strengths are based on the strength design provisions of ACI 318-11 Appendix D assuming dry concrete, periodic inspection, short-term temperature of 180°F and long-term temperature of 110°F.
3. Tabulated values are for a single anchor with no influence of another anchor.
4. Interpolation between embedment depths is not permitted.
5. Strength reduction factor, ϕ , is based on using a load combination from ACI 318-11 Section 9.2.
6. The tension design strength listed for SDC (Seismic Design Category) A-B may also be used in SDC C-F when the tension component of the strength-level seismic design load on the anchor does not exceed 20% of the total factored tension load on the anchor associated with the same load combination.
7. When designing anchorages in SDC C-F, the Designer shall consider the ductility requirements of ACI 318-11 Section D.3.3.
8. Tension design strengths in SDC C-F have been adjusted by 0.75 factor in accordance with ACI 318-11 Section D.3.3.4.4.

* See page 12 for an explanation of the load table icons.

Rebar Size	Allowable Tension Load of Rebar Steel (lb.)	
	ASTM A615 GR 60	ASTM A706 GR 60
#3	4,595	4,085
#4	8,355	7,430
#5	12,955	11,515
#6	18,385	16,345
#7	25,070	22,285
#8	33,010	29,345
#10	52,930	47,170

1. Allowable tension load must be the lesser of the concrete, bond or rebar steel load.
2. Allowable tension loads are calculated based on the strength design provisions of ACI 318-11 Appendix D assuming dry concrete, periodic inspection, short-term temperature of 180°F and long-term temperature of 110°F. Tension design strengths are converted to allowable tension loads using a conversion factor of $\alpha = 1.4$. The conversion factor α is based on the load combination 1.2D + 1.6L assuming 50% dead load and 50% live load: $1.2(0.5) + 1.6(0.5) = 1.4$.
3. Tabulated values are for a single anchor with no influence of another anchor.
4. Interpolation between embedment depths is not permitted.

* See page 12 for an explanation of the load table icons.

Rebar Size	Allowable Tension Load of Rebar Steel (lb.)	
	ASTM A615 GR 60	ASTM A706 GR 60
#3	4,505	4,005
#4	8,190	7,280
#5	12,695	11,285
#6	18,020	16,015
#7	24,570	21,840
#8	32,350	28,755
#10	51,870	46,230

1. Allowable tension load must be the lesser of the concrete, bond or rebar steel load.
2. Allowable tension loads are calculated based on the strength design provisions of ACI 318-11 Appendix D assuming dry concrete, periodic inspection, short-term temperature of 180°F and long-term temperature of 110°F. Tension design strengths are converted to allowable tension loads using a conversion factor of $\alpha = 1/1.43 = 0.7$. The conversion factor α is based on the load combination assuming 100% seismic load.
3. Tabulated values are for a single anchor with no influence of another anchor.
4. Interpolation between embedment depths is not permitted.
5. The allowable tension load listed for SDC (Seismic Design Category) A-B may also be used in SDC C-F when the tension component of the strength-level seismic design load on the anchor does not exceed 20% of the total factored tension load on the anchor associated with the same load combination.
6. When designing anchorages in SDC C-F, the Designer shall consider the ductility requirements of ACI 318-11 Section D.3.3.
7. Allowable tension loads in SDC C-F have been adjusted by 0.75 factor in accordance with ACI 318-11 Section D.3.3.4.4.

* See page 12 for an explanation of the load table icons.

AT-XP® Design Information — Masonry

AT-XP® Allowable Tension and Shear Loads for Threaded Rod and Rebar in the Face of Fully Grouted CMU Wall Construction ^{1, 3, 4, 5, 6, 8, 9, 10, 11}

Diameter (in.) or Rebar Size No.	Drill Bit Diameter (in.)	Minimum Embedment ² (in.)	Allowable Load Based on Bond Strength ⁷ (lb.)	
			Tension Load	Shear Load
Threaded Rod Installed in the Face of CMU Wall				
3/8	1/2	3 3/8	1,265	1,135
1/2	5/8	4 1/2	1,910	1,660
5/8	3/4	5 5/8	2,215	1,810
3/4	7/8	6 1/2	2,260	1,810
Rebar Installed in the Face of CMU Wall				
#3	1/2	3 3/8	1,180	1,315
#4	5/8	4 1/2	1,720	1,565
#5	3/4	5 5/8	1,835	1,565

- Allowable load shall be the lesser of the bond values shown in this table and steel values, shown on page 37.
- Embedment depth shall be measured from the outside face of masonry wall.
- Critical and minimum edge distance and spacing shall comply with the information on page 36. Figure 2 on page 36 illustrates critical and minimum edge and end distances.
- Minimum allowable nominal width of CMU wall shall be 8 inches. No more than one anchor shall be permitted per masonry cell.
- Anchors shall be permitted to be installed at any location in the face of the fully grouted masonry wall construction (cell, web, bed joint), except anchors shall not be installed within 1 1/2 inches of the head joint, as show in Figure 2 on page 36.
- Tabulated allowable load values are for anchors installed in fully grouted masonry walls.
- Tabulated allowable loads are based on a safety factor of 5.0.
- Tabulated allowable load values shall be adjusted for increased base material temperatures in accordance with Figure 1 below, as applicable.
- Threaded rod and rebar installed in fully grouted masonry walls are permitted to resist dead, live, seismic and wind loads.
- Threaded rod shall meet or exceed the tensile strength of ASTM F1554, Grade 36 steel, which is 58,000 psi.
- For installations exposed to severe, moderate or negligible exterior weathering conditions, as defined in Figure 1 of ASTM C62, allowable tension loads shall be multiplied by 0.80.

Adhesive Anchors

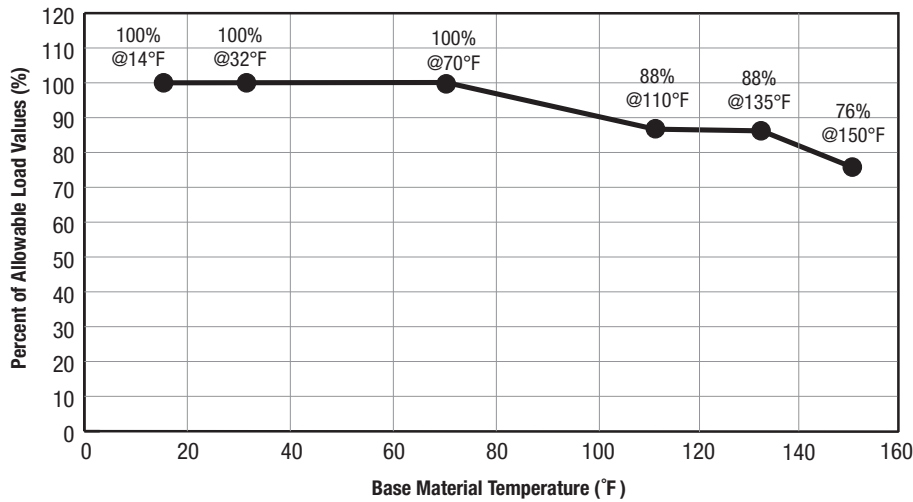

Figure 1. Load capacity based on in-service temperature for AT-XP® adhesive in the face of fully grouted CMU wall construction

* See page 12 for an explanation of the load table icons.

- Edge distance (C_{cr} or C_{min}) is the distance measured from anchor centerline to edge or end of CMU masonry wall. Refer to Figure 2 below for an illustration showing critical and minimum edge and end distances.
- Anchor spacing (S_{cr} or S_{min}) is the distance measured from centerline to centerline of two anchors.
- Critical edge distance, C_{cr} , is the least edge distance at which tabulated allowable load of an anchor is achieved where a load reduction factor equals 1.0 (no load reduction).
- Minimum edge distance, C_{min} , is the least edge distance where an anchor has an allowable load capacity which shall be determined by multiplying the allowable loads assigned to anchors installed at critical edge distance, C_{cr} , by the load reduction factors shown above.
- Critical spacing, S_{cr} , is the least anchor spacing at which tabulated allowable load of an anchor is achieved such that anchor performance is not influenced by adjacent anchors.

- Minimum spacing, S_{min} , is the least spacing where an anchors has an allowable load capacity, which shall be determined by multiplying the allowable loads assigned to anchors installed at critical spacing distance, S_{cr} , by the load reduction factors shown above.
- Reduction factors are cumulative. Multiple reduction factors for more than one spacing or edge or end distance shall be calculated separately and multiplied.
- Load reduction factor for anchors loaded in tension or shear with edge distances between critical and minimum shall be obtained by linear interpolation.
- Load reduction factor for anchors loaded in tension with spacing between critical and minimum shall be obtained by linear interpolation.
- Perpendicular shear loads act towards the edge or end. Parallel shear loads act parallel to the edge or end (see Figure 3 below). Perpendicular and parallel shear load reduction factors are cumulative when the anchor is located between the critical minimum edge and end distance.

Figure 2. Allowable Anchor Locations for Full and Reduced Load Capacity When Installation Is in the Face of Fully Grouted CMU Masonry Wall Construction

Figure 3. Direction of Shear Load in Relation to Edge and End of Wall

- Direction of Shear Load A is parallel to edge of wall and perpendicular to end of wall.
- Direction of Shear Load B is parallel to end of wall and perpendicular to edge of wall.

* See page 12 for an explanation of the load table icons.

1/2	0.142	2,720	5,860	5,155	3,515	1,400	3,020	2,655	1,810
5/8	0.226	4,325	9,325	8,205	5,595	2,230	4,805	4,225	2,880
3/4	0.334	6,395	13,780	12,125	8,265	3,295	7,100	6,245	4,260

1. Allowable load shall be the lesser of bond values given on page 35 and steel values in the table above.
2. Allowable Tension Steel Strength is based on the following equation: $F_v = 0.33 \times F_u \times \text{Tensile Stress Area}$.
3. Allowable Shear Steel Strength is based on the following equation: $F_v = 0.17 \times F_u \times \text{Tensile Stress Area}$.
4. Minimum specified tensile strength ($F_u = 58,000$ psi) of ASTM F1554, Grade 36 used to calculate allowable steel strength.

5. Minimum specified tensile strength ($F_u = 110,000$ psi) of ASTM A193, Grade B6 used to calculate allowable steel strength.
6. Minimum specified tensile strength ($F_u = 125,000$ psi) of ASTM A193, Grade B7 used to calculate allowable steel strength.
7. Minimum specified tensile strength ($F_u = 75,000$ psi) of ASTM A193, Grades B8 and B8M used to calculate allowable steel strength.

AT-XP® Allowable Tension and Shear Loads —
Deformed Reinforcing Bar Based on Steel Strength¹

Drill Bit Diameter (in.)	Minimum Embedment ² (in.)	Tension Load (lb.)		Shear Load (lb.)	
		Based on Steel Strength		Based on Steel Strength

#5	0.31	6,200	7,400	3,690	4,745

1. Allowable load shall be the lesser of bond values given on page 35 and steel values in the table above.
2. Allowable Tension Steel Strength is based on AC58 Section 3.3.3 (20,000 psi x tensile stress area) for Grade 40 rebar.
3. Allowable Tension Steel Strength is based on AC58 Section 3.3.3 (24,000 psi x tensile stress area) for Grade 60 rebar.

4. Allowable Shear Steel Strength is based on AC58 Section 3.3.3 ($F_v = 0.17 \times F_u \times \text{Tensile Stress Area}$).
5. $F_u = 70,000$ psi for Grade 40 rebar.
6. $F_u = 90,000$ psi for Grade 60 rebar.

* See page 12 for an explanation of the load table icons.

SET-XP® High-Strength Epoxy Adhesive

SET-XP® epoxy anchoring adhesive is a high-strength formula for anchoring and doweling in cracked and uncracked concrete and masonry applications. It is a two-part system with the resin and hardener being simultaneously dispensed and mixed through the mixing nozzle. When properly mixed, adhesive will be a uniform teal color for easy post-installation identification.

Features

- 1:1 two-component, high-solids, epoxy-based anchoring adhesive formula
- Passed the demanding ICC-ES AC308 adverse-condition tests pertaining to elevated temperatures and long-term sustained loads
- Code listed under the IBC/IRC for cracked and uncracked concrete per ICC-ES ESR-2508
- Code listed under the IBC/IRC for masonry per IAPMO UES ER-265
- Suitable for use under static and seismic loading conditions in cracked and uncracked concrete and masonry
- Cure times: 24 hours at 70°F, 72 hours at 50°F
- Easy hole-cleaning – no power-brushing required
- Suitable for use in dry or water-saturated concrete
- For best results, store between 45°F and 90°F
- Available in 8.5 oz., 22 oz. and 56 oz. cartridges for application versatility
- Manufactured in the USA using global materials

Applications

- Threaded rod anchoring and rebar doweling into concrete and masonry
- Suitable for horizontal, vertical and overhead applications
- Multiple DOT listings – refer to www.strongtie.com/DOT for current approvals

Codes: ICC-ES ESR-2508 (concrete); IAPMO UES ER-265 (masonry); City of L.A. RR25744 (concrete), RR25965 (masonry); Florida FL-17449.2 (concrete), FL-16230.3 (masonry); AASHTO M-235 and ASTM C881 (Type I and IV, Grade 3, Class C); NSF/ANSI Standard 61 (216 in.²/1,000 gal.)

Chemical Resistance

See pages 320–321.

Installation and Application Instructions

(See also pages 124–127.)

- Surfaces to receive epoxy must be clean.
- Base material temperature must be 50°F or above at the time of installation. For best results, material should be between 70°F and 80°F at time of application.
- To warm cold material, store cartridges in a warm, uniformly heated area or storage container. Do not immerse cartridges in water to facilitate warming.
- Mixed material in nozzle can harden in 30 minutes at temperatures of 70°F and above.

SET-XP® Adhesive

Design Example

See page 328.

Suggested Specifications

See www.strongtie.com for more information.

SET-XP® High-Strength Epoxy Adhesive

Test Criteria

Anchors installed with SET-XP® adhesive have been tested in accordance with ICC-ES *Acceptance Criteria for Post-Installed Adhesive Anchors in Masonry Elements (AC58)* and *Adhesive Anchors in Concrete Elements (AC308)*.

Property	Test Method	Result*
Consistency	ASTM C881	Passed, non-sag
Glass transition temperature	ASTM E1356	155°F
Bond strength (moist cure)	ASTM C882	3,742 psi at 2 days
Water absorption	ASTM D570	0.10%
Compressive yield strength	ASTM D695	14,830 psi
Compressive modulus	ASTM D695	644,000 psi
Shore D Durometer	ASTM D2240	84
Gel time	ASTM C881	49 minutes
Volatile Organic Compound (VOC)	—	3 g/L

*Material and curing conditions: 73 ± 2°F, unless otherwise noted.

SET-XP® Cartridge System

Model No.	Capacity (ounces)	Cartridge Type	Carton Quantity	Dispensing Tool(s)	Mixing Nozzle
SET-XP10 ⁴	8.5	Single	12	CDT10S	EMN22i
SET-XP22-N ⁵	22	Side-by-Side	10	EDT22S, EDTA22P, EDTA22CKT	
SET-XP56	56	Side-by-Side	6	EDTA56P	

1. Cartridge estimation guidelines are available at www.strongtie.com/apps.
2. Detailed information on dispensing tools, mixing nozzles and other adhesive accessories is available on pages 128 through 135, or at www.strongtie.com.
3. Use only Simpson Strong-Tie® mixing nozzles in accordance with Simpson Strong-Tie instructions. Modification or improper use of mixing nozzle may impair SET-XP adhesive performance.
4. Two EMN22i mixing nozzles and two nozzle extensions are supplied with each cartridge.
5. One EMN22i mixing nozzle and one nozzle extension are provided with each cartridge.

Cure Schedule

Base Material Temperature		Cure Time (hrs.)
°F	°C	
50	10	72
60	16	48
70	21	24
90	32	24
110	43	24

For water-saturated concrete, the cure times must be doubled.

SET-XP® Design Information — Concrete

SET-XP® Installation Information and Additional Data
for Threaded Rod and Rebar in Normal-Weight Concrete¹

Characteristic	Symbol	Units	Nominal Anchor Diameter (in.) / Rebar Size						
			3/8 / #3	1/2 / #4	5/8 / #5	3/4 / #6	7/8 / #7	1 / #8	1 1/4 / #10
Installation Information									
Drill Bit Diameter	d_{hole}	in.	1/2	5/8	3/4	7/8	1	1 1/8	1 3/8
Maximum Tightening Torque	T_{inst}	ft.-lb.	10	20	30	45	60	80	125
Permitted Embedment Depth Range	Minimum	h_{ef}	2 3/8	2 3/4	3 1/8	3 1/2	3 3/4	4	5
	Maximum	h_{ef}	7 1/2	10	12 1/2	15	17 1/2	20	25
Minimum Concrete Thickness	h_{min}	in.	$h_{ef} + 5d_o$						
Critical Edge Distance ²	c_{ac}	in.	See footnote 2						
Minimum Edge Distance	c_{min}	in.	1 3/4						2 3/4
Minimum Anchor Spacing	s_{min}	in.	3						6

1. The information presented in this table is to be used in conjunction with the design criteria of ACI 318-11.

2. $c_{ac} = h_{ef} (\tau_{k,uncr} / 1160)^{0.4} \times [3.1 - 0.7(h/h_{ef})]$, where:

$$[h/h_{ef}] \leq 2.4$$

$\tau_{k,uncr}$ = the characteristic bond strength in uncracked concrete, given in the tables that follow $\leq k_{uncr} ((h_{ef} \times f'_c)^{0.5} / (l_T \times d_a))$

h = the member thickness (inches)

h_{ef} = the embedment depth (inches)

* See page 12 for an explanation of the load table icons.

- The information presented in this table is to be used in conjunction with the design criteria of ACI 318-11.
- Temperature Range: Maximum short-term temperature of 150°F. Maximum long-term temperature of 110°F.
- Short-term concrete temperatures are those that occur over short intervals (diurnal cycling).
- Long-term concrete temperatures are constant temperatures over a significant time period.
- For anchors that only resist wind or seismic loads, bond strengths may be increased by 72%.
- In water-saturated concrete, multiply $\tau_{k,uncr}$ and $\tau_{k,cr}$ by K_{sat} .
- The value of ϕ applies when the load combinations of ACI 318 Section 9.2 are used. If the load combinations of ACI 318 Appendix C are used, refer to Section D.4.4 to determine the appropriate value of ϕ .
- The value of ϕ applies when both the load combinations of ACI 318 Section 9.2 are used and the requirements of Section D.4.4 (c) for Condition B are met. If the load combinations of ACI 318 Appendix C are used, refer to Section D.4.4 to determine the appropriate value of ϕ .
- The value of ϕ applies when both the load combinations of ACI 318 Section 9.2 are used and the requirements of Section D.4.4 (c) for Condition B are met. If the load combinations of ACI 318 Section 9.2 are used and the requirements of Section D.4.4 (c) for Condition A are met, refer to Section D.4.4 to determine the appropriate value of ϕ . If the load combinations of ACI 318 Appendix C are used, refer to Section D.4.5 to determine the appropriate value of ϕ .
- For anchors installed in regions assigned to Seismic Design Category C, D, E or F, the bond strength values for 3/8" anchors must be multiplied by $\alpha_{N,seis} = 0.80$.
- For anchors installed in regions assigned to Seismic Design Category C, D, E or F, the bond strength values for 1" anchors must be multiplied by $\alpha_{N,seis} = 0.92$.
- The values of f'_c used for calculation purposes must not exceed 8,000 psi (55.1 MPa) for uncracked concrete. The value of f'_c used for calculation purposes must not exceed 2,500 psi (17.2 MPa) for tension resistance in cracked concrete.
- For applications where maximum short-term temperature is 110°F (43°C) and the maximum long-term temperature is 75°F (24°C), bond strengths may be increased 93%. No additional increase is permitted for anchors that only resist wind or seismic loads.

* See page 12 for an explanation of the load table icons.

Load Bearing Length of Anchor in Shear	l_e	in.	h_{ef}							
Strength Reduction Factor — Breakout Failure	ϕ	—	0.70 ³							
Concrete Pryout Strength in Shear										
Coefficient for Pryout Strength	k_{cp}	—	1.0 for $h_{ef} < 2.50"$; 2.0 for $h_{ef} \geq 2.50"$							
Strength Reduction Factor — Pryout Failure	ϕ	—	0.70 ⁴							

- The information presented in this table is to be used in conjunction with the design criteria of ACI 318-11.
- The value of ϕ applies when the load combinations of ACI 318 Section 9.2 are used. If the load combinations of ACI 318 Appendix C are used, refer to Section D.4.4 to determine the appropriate value of ϕ .
- The value of ϕ applies when both the load combinations of ACI 318 Section 9.2 are used and the requirements of Section D.4.3 (c) for Condition B are met. If the load combinations of ACI 318 Section 9.2 are used and the requirements of Section D.4.3 (c) for Condition A are met, refer to Section D.4.3 to determine

- the appropriate value of ϕ . If the load combinations of ACI 318 Appendix C are used, refer to Section D.4.4 to determine the appropriate value of ϕ .
- The value of ϕ applies when both the load combinations of ACI 318 Section 9.2 are used and the requirements of Section D.4.3 (c) for Condition B are met. If the load combinations of ACI 318 Appendix C are used, refer to Section D.4.4 to determine the appropriate value of ϕ .
- The values of V_{sa} are applicable for both cracked concrete and uncracked concrete. For anchors installed in regions assigned to Seismic Design Category C, D, E or F, V_{sa} must be multiplied by $\alpha_{V,seis}$ for the corresponding anchor steel type.

* See page 12 for an explanation of the load table icons.

#3 (9.5)	1½ (38)	12 (305)	12 (305)	12 (305)	12 (305)	12 (305)
#4 (12.7)	1½ (38)	15 (381)	14 (356)	12 (305)	12 (305)	12 (305)
#5 (15.9)	1½ (38)	18 (457)	17 (432)	15 (381)	12 (305)	12 (305)
#6 (19.1)	1½ (38)	22 (559)	20 (508)	18 (457)	14 (356)	13 (330)
#7 (22.2)	3 (76)	32 (813)	29 (737)	25 (635)	21 (533)	18 (457)
#8 (25.4)	3 (76)	36 (914)	33 (838)	29 (737)	24 (610)	21 (533)
#9 (28.7)	3 (76)	41 (1041)	38 (965)	33 (838)	27 (686)	23 (584)
#10 (32.3)	3 (76)	46 (1168)	42 (1067)	37 (940)	30 (762)	26 (660)
#11 (35.8)	3 (76)	51 (1295)	47 (1194)	41 (1041)	33 (838)	29 (737)

1. Tabulated development lengths are for static, wind and seismic load cases in Seismic Design Category A and B.
2. Rebar is assumed to be ASTM A615 Grade 60 or A706 ($f_y = 60,000$ psi). For rebar with a higher yield strength, multiply tabulated values by $f_y / 60,000$ psi.
3. Concrete is assumed to be normal-weight concrete. For lightweight concrete, multiply tabulated values by 1.33.
4. Tabulated values assume bottom cover of less than 12 inches cast below rebars ($\Psi_t = 1.0$).
5. Uncoated rebar must be used.
6. The value of K_{tr} is assumed to be 0. Refer to ACI 318 Section 12.2.3.

1 1/4	42,150	54,505	90,845	79,945	90,845	41,425

- Tension design strength must be the lesser of the concrete, bond or threaded rod steel design strength.
- Tension design strengths are based on the strength design provisions of ACI 318-11 Appendix D assuming dry concrete, periodic inspection, short-term temperature of 150°F and long-term temperature of 110°F.
- Tabulated values are for a single anchor with no influence of another anchor.
- Interpolation between embedment depths is not permitted.
- Strength reduction factor, ϕ , is based on using a load combination from ACI 318-11 Section 9.2.
- The tension design strength listed for SDC (Seismic Design Category) A-B may also be used in SDC C-F when the tension component of the strength-level seismic design load on the anchor does not exceed 20% of the total factored tension load on the anchor associated with the same load combination.
- When designing anchorages in SDC C-F, the Designer shall consider the ductility requirements of ACI 318-11 Section D.3.3. Design strengths in **Bold** indicate that the anchor ductility requirements of D.3.3.4.3 (a)1 to 3 are satisfied when using ASTM F1554 Grade 36 threaded rod. Any other ductility requirements must be satisfied.
- Tension design strengths in SDC C-F have been adjusted by 0.75 factor in accordance with ACI 318-11 Section D.3.3.4.4.

* See page 12 for an explanation of the load table icons.

1 ¼	30,105	38,930	64,890	57,105	64,890	29,590

1. Allowable tension load must be the lesser of the concrete, bond or threaded rod steel load.
2. Allowable tension loads are calculated based on the strength design provisions of ACI 318-11 Appendix D assuming dry concrete, periodic inspection, short-term temperature of 150°F and long-term temperature of 110°F. Tension design strengths are converted to allowable tension loads using a conversion factor of a = 1.4. The conversion factor a is based on the load combination 1.2D + 1.6L assuming 50% dead load and 50% live load: 1.2(0.5) + 1.6(0.5) = 1.4.
3. Tabulated values are for a single anchor with no influence of another anchor.
4. Interpolation between embedment depths is not permitted.

* See page 12 for an explanation of the load table icons.

1 1/4	29,505	38,155	63,590	55,960	63,590	29,000

- Allowable tension load must be the lesser of the concrete, bond or threaded rod steel load.
- Tabulated values are for a single anchor with no influence of another anchor.
- Interpolation between embedment depths is not permitted.
- See page 12 for an explanation of the load table icons.
- The allowable tension load listed for SDC (Seismic Design Category) A-B may also be used in SDC C-F when the tension component of the strength-level seismic design load on the anchor does not exceed 20% of the total factored tension load on the anchor associated with the same load combination.
- When designing anchorages in SDC C-F, the Designer shall consider the ductility requirements of ACI 318-11 Section D.3.3. Design strengths in **Bold** indicate that the anchor ductility requirements of D.3.3.4.3 (a) 1 to 3 are satisfied when using ASTM F1554 Grade 36 threaded rod. Any other ductility requirements must be satisfied.
- Allowable tension loads in SDC C-F have been adjusted by 0.75 factor in accordance with ACI 318-11 Section D.3.3.4.4.

Rebar Size	Tension Design Strength of Rebar Steel (lb.)	
	ASTM A615 GR 60	ASTM A706 GR 60
#3	6,435	5,720
#4	11,700	10,400
#5	18,135	16,120
#6	25,740	22,880
#7	35,100	31,200
#8	46,215	41,080
#10	74,100	66,040

1. Tension design strength must be the lesser of the concrete, bond or rebar steel design strength.
2. Tension design strengths are based on the strength design provisions of ACI 318-11 Appendix D assuming dry concrete, periodic inspection, short-term temperature of 150°F and long-term temperature of 110°F.
3. Tabulated values are for a single anchor with no influence of another anchor.
4. Interpolation between embedment depths is not permitted.
5. Strength reduction factor, ϕ , is based on using a load combination from ACI 318-11 Section 9.2.
6. The tension design strength listed for SDC (Seismic Design Category) A-B may also be used in SDC C-F when the tension component of the strength-level seismic design load on the anchor does not exceed 20% of the total factored tension load on the anchor associated with the same load combination.
7. When designing anchorages in SDC C-F, the Designer shall consider the ductility requirements of ACI 318-11 Section D.3.3.
8. Tension design strengths in SDC C-F have been adjusted by 0.75 factor in accordance with ACI 318-11 Section D.3.3.4.4.

* See page 12 for an explanation of the load table icons.

Rebar Size	Allowable Tension Load of Rebar Steel (lb.)	
	ASTM A615 GR 60	ASTM A706 GR 60
#3	4,595	4,085
#4	8,355	7,430
#5	12,955	11,515
#6	18,385	16,345
#7	25,070	22,285
#8	33,010	29,345
#10	52,930	47,170

1. Allowable tension load must be the lesser of the concrete, bond or rebar steel load.
2. Allowable tension loads are calculated based on the strength design provisions of ACI 318-11 Appendix D assuming dry concrete, periodic inspection, short-term temperature of 150°F and long-term temperature of 110°F. Tension design strengths are converted to allowable tension loads using a conversion factor of $\alpha = 1.4$. The conversion factor α is based on the load combination 1.2D + 1.6L assuming 50% dead load and 50% live load: $1.2(0.5) + 1.6(0.5) = 1.4$.
3. Tabulated values are for a single anchor with no influence of another anchor.
4. Interpolation between embedment depths is not permitted.

* See page 12 for an explanation of the load table icons.

Rebar Size	Allowable Tension Load of Rebar Steel (lb.)	
	ASTM A615 GR 60	ASTM A706 GR 60
#3	3,860	3,430
#4	7,020	6,240
#5	10,880	9,670
#6	15,445	13,730
#7	21,060	18,720
#8	27,730	24,650
#10	44,460	39,625

1. Allowable tension load must be the lesser of the concrete, bond or rebar steel load.
2. Allowable tension loads are calculated based on the strength design provisions of ACI 318-11 Appendix D assuming dry concrete, periodic inspection, short-term temperature of 150°F and long-term temperature of 110°F. Tension design strengths are converted to allowable tension loads using α conversion factor of $\alpha = \frac{1}{1.67}$. The conversion factor α is based on the load combination assuming 100% wind load.
3. Tabulated values are for a single anchor with no influence of another anchor.
4. Interpolation between embedment depths is not permitted.

* See page 12 for an explanation of the load table icons.

Rebar Size	Allowable Tension Load of Rebar Steel (lb.)	
	ASTM A615 GR 60	ASTM A706 GR 60
#3	4,505	4,005
#4	8,190	7,280
#5	12,695	11,285
#6	18,020	16,015
#7	24,570	21,840
#8	32,350	28,755
#10	51,870	46,230

1. Allowable tension load must be the lesser of the concrete, bond or rebar steel load.
2. Allowable tension loads are calculated based on the strength design provisions of ACI 318-11 Appendix D assuming dry concrete, periodic inspection, short-term temperature of 150°F and long-term temperature of 110°F. Tension design strengths are converted to allowable tension loads using α conversion factor of $\alpha = 1/1.43 = 0.7$. The conversion factor α is based on the load combination assuming 100% seismic load.
3. Tabulated values are for a single anchor with no influence of another anchor.
4. Interpolation between embedment depths is not permitted.
5. The allowable tension load listed for SDC (Seismic Design Category) A-B may also be used in SDC C-F when the tension component of the strength-level seismic design load on the anchor does not exceed 20% of the total factored tension load on the anchor associated with the same load combination.
6. When designing anchorages in SDC C-F, the Designer shall consider the ductility requirements of ACI 318-11 Section D.3.3.
7. Allowable tension loads in SDC C-F have been adjusted by 0.75 factor in accordance with ACI 318-11 Section D.3.3.4.4.

* See page 12 for an explanation of the load table icons.

Adhesive Anchors

SET-XP® Design Information — Masonry

SET-XP® Allowable Tension and Shear Loads for Threaded Rod and Rebar in the Face of Fully Grouted CMU Wall Construction ^{1, 3, 4, 5, 6, 8, 9, 10, 11}

Adhesive Anchors

Diameter (in.) or Rebar Size No.	Drill Bit Diameter (in.)	Minimum Embedment ² (in.)	Allowable Load Based on Bond Strength ⁷ (lb.)	
			Tension Load	Shear Load
Threaded Rod Installed in the Face of CMU Wall				
3/8	1/2	3 3/8	1,490	1,145
1/2	5/8	4 1/2	1,825	1,350
5/8	3/4	5 5/8	1,895	1,350
3/4	7/8	6 1/2	1,895	1,350
Rebar Installed in the Face of CMU Wall				
#3	1/2	3 3/8	1,395	1,460
#4	5/8	4 1/2	1,835	1,505
#5	3/4	5 5/8	2,185	1,505

- Allowable load shall be the lesser of the bond values shown in this table and steel values, shown on page 61.
- Embedment depth shall be measured from the outside face of masonry wall.
- Critical and minimum edge distance and spacing shall comply with the information on page 55. Figure 2 on page 55 illustrates critical and minimum edge and end distances.
- Minimum allowable nominal width of CMU wall shall be 8 inches. No more than one anchor shall be permitted per masonry cell.
- Anchors shall be permitted to be installed at any location in the face of the fully grouted masonry wall construction (cell, web, bed joint), except anchors shall not be installed within 1 1/2 inches of the head joint, as show in Figure 2 on page 55.
- Tabulated allowable load values are for anchors installed in fully grouted masonry walls.
- Tabulated allowable loads are based on a safety factor of 5.0 .
- Tabulated allowable load values shall be adjusted for increased base material temperatures in accordance with Figure 1 below, as applicable.
- Threaded rod and rebar installed in fully grouted masonry walls are permitted to resist dead, live, seismic and wind loads.
- Threaded rod shall meet or exceed the tensile strength of ASTM F1554, Grade 36 steel, which is 58,000 psi.
- For installations exposed to severe, moderate or negligible exterior weathering conditions, as defined in Figure 1 of ASTM C62, allowable tension loads shall be multiplied by 0.80.

Figure 1. Load capacity based on in-service temperature for SET-XP® epoxy adhesive in the face of fully grouted CMU wall construction

* See page 12 for an explanation of the load table icons.

#3	3%	12	1.00	4	0.96	0.62	0.84	8	1.00	4	0.87	0.91
#4	4 1/2	12	1.00	4	0.88	0.54	0.82	8	1.00	4	0.87	0.91
#5	5%	12	1.00	4	0.88	0.43	0.82	8	1.00	4	0.87	1.00

- Edge distance (C_{cr} or C_{min}) is the distance measured from anchor centerline to edge or end of CMU masonry wall. Refer to Figure 2 below for an illustration showing critical and minimum edge and end distances.
- Anchor spacing (S_{cr} or S_{min}) is the distance measured from centerline to centerline of two anchors.
- Critical edge distance, C_{cr} , is the least edge distance at which tabulated allowable load of an anchor is achieved where a load reduction factor equals 1.0 (no load reduction).
- Minimum edge distance, C_{min} , is the least edge distance where an anchor has an allowable load capacity which shall be determined by multiplying the allowable loads assigned to anchors installed at critical edge distance, C_{cr} , by the load reduction factors shown above.
- Critical spacing, S_{cr} , is the least anchor spacing at which tabulated allowable load of an anchor is achieved such that anchor performance is not influenced by adjacent anchors.
- Minimum spacing, S_{min} , is the least spacing where an anchor has an allowable load capacity, which shall be determined by multiplying the allowable loads assigned to anchors installed at critical spacing distance, S_{cr} , by the load reduction factors shown above.
- Reduction factors are cumulative. Multiple reduction factors for more than one spacing or edge or end distance shall be calculated separately and multiplied.
- Load reduction factor for anchors loaded in tension or shear with edge distances between critical and minimum shall be obtained by linear interpolation.
- Load reduction factor for anchors loaded in tension with spacing between critical and minimum shall be obtained by linear interpolation.
- Perpendicular shear loads act towards the edge or end. Parallel shear loads act parallel to the edge or end (see Figure 5 on page 57). Perpendicular and parallel shear load reduction factors are cumulative when the anchor is located between the critical minimum edge and end distance.

Figure 2. Allowable anchor locations for full and reduced load capacity when installation is in the face of fully grouted CMU masonry wall construction

* See page 12 for an explanation of the load table icons.

SET-XP® Design Information — Masonry

SET-XP® Allowable Tension and Shear Loads for Threaded Rod and Rebar in the Top of Fully Grouted CMU Wall Construction^{1, 2, 4, 5, 6, 7, 9, 10, 11, 12}

Diameter (in.) or Rebar Size No.	Drill Bit Diameter (in.)	Minimum Embedment ³ (in.)	Allowable Load Based on Bond Strength ^{7, 8} (lb.)

#5	3/4	5 5/8	1,345	590	1,140
		15	3,090	590	1,285

1. Allowable load shall be the lesser of the bond values shown in this table and steel values, shown on page 61.
2. Allowable loads are for installation in the grouted CMU core opening.
3. Embedment depth shall be measured from the horizontal surface of the grouted CMU core opening on top of the masonry wall.
4. Critical and minimum edge distance, end distance and spacing shall comply with the information on pages 57 and 58. Figures 3A and 3B on page 57 illustrate critical and minimum edge and end distances.
5. Minimum allowable nominal width of CMU wall shall be 8 inches (203 mm).
6. Anchors are permitted to be installed in the CMU core opening shown in Figures 3A and 3B on page 57. Anchors are limited to one installation per CMU core opening.
7. Tabulated allowable load values are for anchors installed in fully grouted masonry walls.
8. Tabulated allowable loads are based on a safety factor of 5.0.
9. Tabulated allowable load values shall be adjusted for increased base material temperatures in accordance with Figure 1 on page 54, as applicable.
10. Threaded rod and rebar installed in fully grouted masonry walls with SET-XP® adhesive are permitted to resist dead, live, seismic and wind loads.
11. Threaded rod shall meet or exceed the tensile strength of ASTM F1554, Grade 36 steel, which is 58,000 psi.
12. For installations exposed to severe, moderate or negligible exterior weathering conditions, as defined in Figure 1 of ASTM C62, allowable tension loads shall be multiplied by 0.80.

* See page 12 for an explanation of the load table icons.

Adhesive Anchors

1. Edge and end distances (C_{cr} or C_{min}) are the distances measured from anchor centerline to edge or end of CMU masonry wall. Refer to Figures 3A and 3B below for illustrations showing critical and minimum edge and end distances.
2. Critical edge and end distances, C_{cr} , are the least edge distances at which tabulated allowable load of an anchor is achieved where a load reduction factor equals 1.0 (no load reduction).
3. Minimum edge and end distances, C_{min} , are the least edge distances where an anchor has an allowable load capacity, which shall be determined by multiplying the allowable loads assigned to anchors installed at critical edge distance, C_{cr} , by the load reduction factors shown above.
4. Reduction factors are cumulative. Multiple reduction factors for more than one spacing or edge or end distance shall be calculated separately and multiplied.
5. Load reduction factor for anchors loaded in tension or shear with edge distances between critical and minimum shall be obtained by linear interpolation.
6. Perpendicular shear loads act towards the edge or end. Parallel shear loads act parallel to the edge or end (see Figure 5 below). Perpendicular and parallel shear load reduction factors are cumulative when the anchor is located between the critical minimum edge and end distance.

Figure 3A. Allowable anchor locations of 1/2"- and 5/8"-diameter threaded rod for full and reduced load capacity when installation is in the top of fully grouted CMU masonry wall construction

Figure 3B. Allowable anchor locations of 7/8"-diameter threaded rod and #4 and #5 rebar for full and reduced load capacity when installation is in the top of fully grouted CMU masonry wall construction

1. Direction of shear load A is parallel to edge of wall and perpendicular to end of wall.
2. Direction of shear load B is parallel to end of wall and perpendicular to edge of wall.
3. Direction of shear load C is perpendicular to edge of wall.

Figure 5. Direction of shear load in relation to edge and end of wall

* See page 12 for an explanation of the load table icons.

SET-XP® Design Information — Masonry

SET-XP® Allowable Tension and Shear Loads – Threaded Rod in the Face of Hollow CMU Wall Construction^{1,3,4,5,6,8,9,10,11}

Diameter (in.)	Drill Bit Diameter (in.)	Minimum Embed ² (in.)	Allowable Load Based on Bond Strength ⁷ (lb.)	
			Tension	Shear
3/8	9/16	1 1/4	245	415
1/2	3/4	1 1/4	245	505
5/8	7/8	1 1/4	290	530

1. Allowable load shall be the lesser of bond values shown in this table and steel values shown on page 61.
2. Embedment depth is considered the minimum wall thickness of 8" x 8" x 16" ASTM C90 concrete masonry blocks, and is measured from the outside to the inside face of the block wall. The minimum length Opti-Mesh plastic screen tube for use in hollow CMU is 3 1/2".
3. Critical and minimum edge distance and spacing shall comply with the information provided on page 60. Figure 4 on page 60 illustrates critical and minimum edge and end distances.
4. Anchors are permitted to be installed in the face shell of hollow masonry wall construction as shown in Figure 4.
5. Anchors are limited to one or two anchors per masonry cell and must comply with the spacing and edge distance requirements provided.
6. Tabulated load values are for anchors installed in hollow masonry walls.
7. Tabulated allowable loads are based on a safety factor of 5.0.
8. Tabulated allowable load values shall be adjusted for increased base material temperatures in accordance with Figure 1 on page 54, as applicable.
9. Threaded rods installed in hollow masonry walls with SET-XP® adhesive are permitted to resist dead, live load and wind load applications.
10. Threaded rods must meet or exceed the tensile strength of ASTM F1554, Grade 36, which is 58,000 psi.
11. For installations exposed to severe, moderate or negligible exterior weathering conditions, as defined in Figure 1 of ASTM C62, allowable tension loads must be multiplied by 0.80.

* See page 12 for an explanation of the load table icons.

SET-XP® Design Information — Masonry

SET-XP® Edge, End and Spacing Distance Requirements and Allowable Load Reduction Factors — Threaded Rod in the Face of Hollow CMU Wall Construction⁷

Adhesive Anchors

Rod Diameter (in.)	Edge or End Distance ^{1,8}					Spacing ^{2,9}				
	Critical (Full Anchor Capacity) ³		Minimum (Reduced Anchor Capacity) ⁴			Critical (Full Anchor Capacity) ⁵		Minimum (Reduced Anchor Capacity) ⁶		
	Critical Edge or End Distance, C_{cr} (in.)	Allowable Load Reduction Factor	Minimum Edge or End Distance, C_{min} (in.)	Allowable Load Reduction Factor		Critical Spacing, S_{cr} (in.)	Allowable Load Reduction Factor	Minimum Spacing, S_{min} (in.)	Allowable Load Reduction Factor	
	Load Direction		Load Direction			Load Direction		Load Direction		
Tension or Shear	Tension or Shear	Tension or Shear	Tension	Shear ¹⁰	Tension or Shear	Tension or Shear	Tension or Shear	Tension	Shear	
3/8	12	1.00	4	0.71	0.57	8	1.00	4	0.56	0.92
1/2	12	1.00	4	0.73	0.51	8	1.00	4	0.61	0.85
5/8	12	1.00	4	0.66	0.49	8	1.00	4	0.65	0.76

- Edge and end distances (C_{cr} or C_{min}) are the distances measured from anchor centerline to edge or end of CMU masonry wall. Refer to Figure 4 below for an illustration showing critical and minimum edge and end distances.
- Anchor spacing (S_{cr} or S_{min}) is the distance measured from centerline to centerline of two anchors.
- Critical edge and end distances, C_{cr} , are the least edge distances at which tabulated allowable load of an anchor is achieved where a load reduction factor equals 1.0 (no load reduction).
- Minimum edge and end distances, C_{min} , are the least edge distances where an anchor has an allowable load capacity which shall be determined by multiplying the allowable loads assigned to anchors installed at critical edge distance, C_{cr} , by the load reduction factors shown above.
- Critical spacing, S_{cr} , is the least anchor spacing at which tabulated allowable load of an anchor is achieved such that anchor performance is not influenced by adjacent anchors.
- Minimum spacing, S_{min} , is the least spacing where an anchor has an allowable load capacity, which shall be determined by multiplying the allowable loads assigned to anchors installed at critical spacing distance, S_{cr} , by the load reduction factors shown above.
- Reduction factors are cumulative. Multiple reduction factors for more than one spacing or edge or end distance shall be calculated separately and multiplied.
- Load reduction factor for anchors loaded in tension or shear with edge distances between critical and minimum shall be obtained by linear interpolation.
- Load reduction factor for anchors loaded in tension with spacing between critical and minimum shall be obtained by linear interpolation.
- Perpendicular shear loads act toward the edge or end. Parallel shear loads act parallel to the edge or end (see Figure 5 on page 57). Perpendicular and parallel shear load reduction factors are cumulative when the anchor is located between the critical minimum edge and end distance.

Figure 4. Allowable anchor locations for full and reduced load capacity when installation is in the face of hollow CMU masonry wall construction

* See page 12 for an explanation of the load table icons.

3/4	0.334	6,395	13,780	12,125	8,265	3,295	7,100	6,245	4,260
7/8	0.462	8,845	19,055	16,770	11,435	4,555	9,815	8,640	5,890

1. Allowable load shall be the lesser of bond values given on pages 54, 56 or 59 and steel values in the table above.
2. Allowable Tension Steel Strength is based on the following equation: $F_v = 0.33 \times F_u \times \text{Tensile Stress Area}$.
3. Allowable Shear Steel Strength is based on the following equation: $F_v = 0.17 \times F_u \times \text{Tensile Stress Area}$.
4. Minimum specified tensile strength ($F_u = 58,000$ psi) of ASTM F1554, Grade 36 used to calculate allowable steel strength.
5. Minimum specified tensile strength ($F_u = 110,000$ psi) of ASTM A193, Grade B6 used to calculate allowable steel strength.
6. Minimum specified tensile strength ($F_u = 125,000$ psi) of ASTM A193, Grade B7 used to calculate allowable steel strength.
7. Minimum specified tensile strength ($F_u = 75,000$ psi) of ASTM A193, Grades B8 and B8M used to calculate allowable steel strength.

SET-XP® Allowable Tension and Shear Loads —
Deformed Reinforcing Bar Based on Steel Strength¹

Rebar Size	Tensile Stress Area (in. ²)	Tension Load (lb.)		Shear Load (lb.)	
		Based on Steel Strength		Based on Steel Strength	
		ASTM A615 Grade 40 ²	ASTM A615 Grade 60 ³	ASTM A615 Grade 40 ^{4,5}	ASTM A615 Grade 60 ^{4,5}

#5	0.31	6,200	7,400	3,690	4,745

1. Allowable load shall be the lesser of bond values given on pages 54, 56 or 59 and steel values in the table above.
2. Allowable Tension Steel Strength is based on AC58 Section 3.3.3 (20,000 psi x tensile stress area) for Grade 40 rebar.
3. Allowable Tension Steel Strength is based on AC58 Section 3.3.3 (24,000 psi x tensile stress area) for Grade 60 rebar.
4. Allowable Shear Steel Strength is based on AC58 Section 3.3.3 ($F_v = 0.17 \times F_u \times \text{Tensile Stress Area}$.)
5. $F_u = 70,000$ psi for Grade 40 rebar.
6. $F_u = 90,000$ psi for Grade 60 rebar.

* See page 12 for an explanation of the load table icons.

ET-HP® Epoxy Adhesive

ET-HP® is a two-component, high-solids, epoxy-based system for use as a high-strength, non-shrink anchor-grouting material. Resin and hardener are dispensed and mixed simultaneously through the mixing nozzle. ET-HP® is formulated for anchoring threaded rod and rebar into concrete (cracked/uncracked) and masonry.

Features

- Passed the demanding ICC-ES AC308 adverse-condition tests pertaining to elevated temperatures and long-term sustained loads
- Code listed under the IBC/IRC for cracked and uncracked concrete per ICC-ES ESR-3372
- Code listed under the IBC/IRC for masonry per IAPMO UES ER-241
- Suitable for use under static and seismic loading conditions in cracked and uncracked concrete and masonry
- Cure times: 24 hours at 80°F, 72 hours at 50°F
- Easy hole-cleaning – no power-brushing required
- Suitable for use in dry or water-saturated concrete
- When properly mixed, adhesive will be a uniform gray color
- Available in 22 oz. and 56 oz. cartridges for application versatility
- Manufactured in the USA using global materials

Applications

- Threaded rod anchoring and rebar doweling into concrete and unreinforced masonry
- Suitable for horizontal, vertical and overhead applications
- Multiple DOT listings – refer to www.strongtie.com/DOT for current approvals

Codes: ICC-ES ESR-3372 (concrete); ICC-ES ESR-3638 (unreinforced masonry); IAPMO UES ER-241 (masonry); City of L.A. RR25120 (unreinforced masonry); AASHTO M-235 and ASTM C881 (Type IV, Grade 3, Class C); multiple DOT listings; FL-17449.1; FL-16230.2.

Chemical Resistance

See pages 320–321.

Installation and Application Instructions

(See also pages 124–127.)

- Surfaces to receive epoxy must be clean.
- Base material temperature must be 50°F or above at the time of installation. For best results, material should be 70°–80°F at time of application.
- To warm cold material, store cartridges in a warm, uniformly heated area or storage container. Do not immerse cartridges in water to facilitate warming.
- Mixed material in nozzle can harden in 30 minutes at temperatures of 70°F and above.

ET-HP® Adhesive

Design Example

See pages 324 and 328.

Suggested Specifications

See www.strongtie.com for more information.

ET-HP® Epoxy Adhesive

Test Criteria

Anchors installed with ET-HP® adhesive have been tested in accordance with ICC-ES Acceptance Criteria for Post-Installed *Adhesive Anchors in Masonry Elements (AC58)* and *Adhesive Anchors in Concrete Elements (AC308)*.

Property	Test Method	Result*
Consistency	ASTM C881	Non-sag/thixotropic paste
Heat deflection	ASTM D648	133°F (56°C)
Glass transition temperature	ASTM D648	168°F (76°C)
Bond strength (moist cure, 60°F)	ASTM C882	2,300 psi (2 days) 2,440 psi (14 days)
Water absorption	ASTM D570	0.34% (24 hours)
Compressive yield strength (cured 60°F)	ASTM D695	16,300 psi (7 days)
Compressive modulus	ASTM D695	595,500 psi (7 days)
Gel time	ASTM C881	10 minutes – 60 gram mass 30 minutes – thin film
Shore D Durometer	ASTM D2240	87
Volatile Organic Compound (VOC)	—	3 g/L

*Material and curing conditions: 73 ± 2°F unless otherwise noted.

ET-HP® Cartridge Systems

Model No.	Capacity ounces	Cartridge Type	Carton Quantity	Dispensing Tools	Mixing Nozzle
ET-HP22-N ⁴	22	Side-by-side	10	EDT22S EDTA22CKT EDTA22P	EMN22i
ET-HP22	22	Side-by-side	10		EMN22i
ET-HP56	56	Side-by-side	6	EDTA56P	EMN22i or EMN50

1. Cartridge estimation guidelines are available at www.strongtie.com/apps.
2. Detailed information on dispensing tools, mixing nozzles and other adhesive accessories is available on pages 128 through 135, or at www.strongtie.com.
3. Use only Simpson Strong-Tie® mixing nozzles in accordance with Simpson Strong-Tie instructions. Modification or improper use of mixing nozzle may impair ET-HP adhesive performance.
4. One EMN22i mixing nozzle and one nozzle extension are supplied with each cartridge.

Cure Schedule

Base Material Temperature		Cure Time
°F	°C	
50	10	72 hrs.
60	16	24 hrs.
80	27	24 hrs.
100	38	24 hrs.

For water-saturated concrete, the cure times must be doubled.

ET-HP® Design Information — Concrete

ET-HP® Installation Information and Additional Data for Threaded Rod and Rebar in Normal-Weight Concrete¹

Characteristic	Symbol	Units	Nominal Anchor Diameter (in.) / Rebar Size						
			3/8 / #3	1/2 / #4	5/8 / #5	3/4 / #6	7/8 / #7	1 / #8	1 1/4 / #10
Installation Information									
Drill Bit Diameter	d_{hole}	in.	1/2	5/8	3/4	7/8	1	1 1/8	1 3/8
Maximum Tightening Torque	T_{inst}	ft.-lb.	10	20	30	45	60	80	125
Permitted Embedment Depth Range	Minimum	h_{ef}	2 3/8	2 3/4	3 1/8	3 1/2	3 3/4	4	5
	Maximum	h_{ef}	4 1/2	6	7 1/2	9	10 1/2	12	15
Minimum Concrete Thickness	h_{min}	in.	$h_{ef} + 5d_o$						
Critical Edge Distance ²	c_{ac}	in.	See footnote 2						
Minimum Edge Distance	c_{min}	in.	1 3/4						2 3/4
Minimum Anchor Spacing	s_{min}	in.	3						6

1. The information presented in this table is to be used in conjunction with the design criteria of ACI 318-11.

2. $c_{ac} = h_{ef}(\tau_{k,uncr}/1160)^{0.4} \times [3.1 - 0.7(h/h_{ef})]$, where:

$$[h/h_{ef}] \leq 2.4$$

$\tau_{k,uncr}$ = the characteristic bond strength in uncracked concrete, given in the tables that follow $\leq k_{uncr}((h_{ef} \times f_c)^{0.5}/(T \times d_a))$

h = the member thickness (inches)

h_{ef} = the embedment depth (inches)

* See page 12 for an explanation of the load table icons.

Bond Strength in Tension — Bond Strength Reduction Factors for Periodic Special Inspection											
Strength Reduction Factor — Dry Concrete		ϕ_{dry}	—	0.65 ⁷							
Strength Reduction Factor — Water-Saturated Concrete		ϕ_{sat}	—	0.45 ⁷							

- The information presented in this table is to be used in conjunction with the design criteria of ACI 318-11.
- Temperature Range: Maximum short-term temperature of 150°F (66°C). Maximum long-term temperature of 110°F (43°C).
- Short-term concrete temperatures are those that occur over short intervals (diurnal cycling).
- Long-term concrete temperatures are constant temperatures over a significant time period.
- For anchors that only resist wind or seismic loads, bond strengths may be multiplied by 2.70.
- The value of ϕ applies when the load combinations of ACI 318 Section 9.2 are used. If the load combinations of ACI 318 Appendix C are used, refer to Section D.4.5 to determine the appropriate value of ϕ .
- The value of ϕ applies when both the load combinations of ACI 318 Section 9.2 are used and the requirements of Section D.4.4 (c) for Condition B are met. If the load combinations of ACI 318 Appendix C are used, refer to Section D.4.5 to determine the appropriate value of ϕ .
- The value of ϕ applies when both the load combinations of ACI 318 Section 9.2 are used and the requirements of Section D.4.4 (c) for Condition B are met. If the load combinations of ACI 318 Section 9.2 are used and the requirements of Section D.4.4 (c) for Condition A are met, refer to Section D.4.4 to determine the appropriate value of ϕ . If the load combinations of ACI 318 Appendix C are used, refer to Section D.4.5 to determine the appropriate value of ϕ .
- For anchors installed in regions assigned to Seismic Design Category C, D, E or F, the bond strength values for 3/8" and 1/4" anchors must be multiplied by $\alpha_{N,seis} = 0.78$.
- For anchors installed in regions assigned to Seismic Design Category C, D, E or F, the bond strength values for 1/2", 5/8" and 3/4" anchors must be multiplied by $\alpha_{N,seis} = 0.85$.
- For anchors installed in regions assigned to Seismic Design Category C, D, E or F, the bond strength values for 7/8" anchors must be multiplied by $\alpha_{N,seis} = 0.82$.
- For anchors installed in regions assigned to Seismic Design Category C, D, E or F, the bond strength values for 1" anchors must be multiplied by $\alpha_{N,seis} = 0.70$.
- For applications where maximum short-term temperature is 110°F (43°C) and the maximum long-term temperature is 75°F (24°C), bond strengths may be multiplied by 3.50. No additional increase is permitted for anchors that only resist wind or seismic loads.

* See page 12 for an explanation of the load table icons.

	Load Bearing Length of Anchor in Shear	ℓ_e	in.	h_{ef}						
	Strength Reduction Factor — Breakout Failure	ϕ	—	0.70 ³						
Concrete Pryout Strength in Shear										
	Coefficient for Pryout Strength	k_{cp}	—	1.0 for $h_{ef} < 2.50"$; 2.0 for $h_{ef} \geq 2.50"$						
	Strength Reduction Factor — Pryout Failure	ϕ	—	0.70 ⁴						

- The information presented in this table is to be used in conjunction with the design criteria of ACI 318-11.
- The value of ϕ applies when the load combinations of ACI 318 Section 9.2 are used. If the load combinations of ACI 318 Appendix C are used, refer to Section D.4.4 to determine the appropriate value of ϕ .
- The value of ϕ applies when both the load combinations of ACI 318 Section 9.2 are used and the requirements of Section D.4.3 (c) for Condition B are met. If the load combinations of ACI 318 Section 9.2 are used and the requirements of Section D.4.3 (c) for Condition A are met, refer to Section D.4.3 to determine the appropriate value of ϕ . If the load combinations of ACI 318 Appendix C are used, refer to Section D.4.4 to determine the appropriate value of ϕ .
- The value of ϕ applies when both the load combinations of ACI 318 Section 9.2 are used and the requirements of Section D.4.3 (c) for Condition B are met. If the load combinations of ACI 318 Appendix C are used, refer to Section D.4.4 to determine the appropriate value of ϕ .
- The values of V_{sa} are applicable for both cracked concrete and uncracked concrete. For anchors installed in regions assigned to Seismic Design Category C, D, E or F, V_{sa} must be multiplied by $\alpha_{V_{seis}}$ for the corresponding anchor steel type.

Adhesive Anchors

Adhesive Anchors

Threaded Rod Dia. (in.)	Tension Design Strength of Threaded Rod Steel (lb.)					
	ASTM F1554 GR 36	ASTM F1554 GR 55	ASTM F1554 GR 105	ASTM A193 B6	ASTM A193 B7	ASTM A193 B8/B8M
3/8	3,370	4,360	7,270	6,395	7,270	3,310
1/2	6,175	7,990	13,315	11,715	13,315	6,070
5/8	9,835	12,715	21,190	18,645	21,190	9,660
3/4	14,530	18,790	31,315	27,555	31,315	14,280
7/8	20,095	25,990	43,315	38,115	43,315	19,750
1	26,365	34,090	56,815	49,995	56,815	25,905
1 1/4	42,150	54,505	90,845	79,945	90,845	41,425

1. Tension design strength must be the lesser of the concrete, bond or threaded rod steel design strength.
2. Tension design strengths are based on the strength design provisions of ACI 318-11 Appendix D assuming dry concrete, periodic inspection, short-term temperature of 150°F and long-term temperature of 110°F.
3. Tabulated values are for a single anchor with no influence of another anchor.
4. Interpolation between embedment depths is not permitted.
5. Strength reduction factor, ϕ , is based on using a load combination from ACI 318-11 Section 9.2.
6. The tension design strength listed for SDC (Seismic Design Category) A-B may also be used in SDC C-F when the tension component of the strength-level seismic design load on the anchor does not exceed 20% of the total factored tension load on the anchor associated with the same load combination.
7. When designing anchorages in SDC C-F, the Designer shall consider the ductility requirements of ACI 318-11 Section D.3.3. Design strengths in **Bold** indicate that the anchor ductility requirements of D.3.3.4.3 (a)1 to 3 are satisfied when using ASTM F1554 Grade 36 threaded rod. Any other ductility requirements must be satisfied.
8. Tension design strengths in SDC C-F have been adjusted by 0.75 factor in accordance with ACI 318-11 Section D.3.3.4.4.

* See page 12 for an explanation of the load table icons.

1¼	30,105	38,930	64,890	57,105	64,890	29,590

1. Allowable tension load must be the lesser of the concrete, bond or threaded rod steel load.
2. Allowable tension loads are calculated based on the strength design provisions of ACI 318-11 Appendix D assuming dry concrete, periodic inspection, short-term temperature of 150°F and long-term temperature of 110°F. Tension design strengths are converted to allowable tension loads using a conversion factor of $\alpha = 1.4$. The conversion factor α is based on the load combination 1.2D + 1.6L assuming 50% dead load and 50% live load: $1.2(0.5) + 1.6(0.5) = 1.4$.
3. Tabulated values are for a single anchor with no influence of another anchor.
4. Interpolation between embedment depths is not permitted.

* See page 12 for an explanation of the load table icons.

1 1/4	29,505	38,155	63,590	55,960	63,590	29,000

1. Allowable tension load must be the lesser of the concrete, bond or threaded rod steel load.
2. Allowable tension loads are calculated based on the strength design provisions of ACI 318-11 Appendix D assuming dry concrete, periodic inspection, short-term temperature of 150°F and long-term temperature of 110°F. Tension design strengths are converted to allowable tension loads using a conversion factor of $\alpha = \frac{1}{1.43} = 0.7$. The conversion factor α is based on the load combination assuming 100% seismic load.
3. Tabulated values are for a single anchor with no influence of another anchor.
4. Interpolation between embedment depths is not permitted.
5. The allowable tension load listed for SDC (Seismic Design Category) A-B may also be used in SDC C-F when the tension component of the strength-level seismic design load on the anchor does not exceed 20% of the total factored tension load on the anchor associated with the same load combination.
6. When designing anchorages in SDC C-F, the Designer shall consider the ductility requirements of ACI 318-11 Section D.3.3.
7. Design strengths in **Bold** indicate that the anchor ductility requirements of D.3.3.4.3 (a)1 to 3 are satisfied when using ASTM F1554 Grade 36 threaded rod. Any other ductility requirements must be satisfied.
8. Allowable tension loads in SDC C-F have been adjusted by 0.75 factor in accordance with ACI 318-11 Section D.3.3.4.4.

* See page 12 for an explanation of the load table icons.

1. Allowable tension load must be the lesser of the concrete, bond or rebar steel load.
2. Allowable tension loads are calculated based on the strength design provisions of ACI 318-11 Appendix D assuming dry concrete, periodic inspection, short-term temperature of 150°F and long-term temperature of 110°F. Tension design strengths are converted to allowable tension loads using a conversion factor of $\alpha = 1/1.43 = 0.7$. The conversion factor α is based on the load combination assuming 100% seismic load.
3. Tabulated values are for a single anchor with no influence of another anchor.
4. Interpolation between embedment depths is not permitted.
5. The allowable tension load listed for SDC (Seismic Design Category) A-B may also be used in SDC C-F when the tension component of the strength-level seismic design load on the anchor does not exceed 20% of the total factored tension load on the anchor associated with the same load combination.
6. When designing anchorages in SDC C-F, the Designer shall consider the ductility requirements of ACI 318-11 Section D.3.3.
7. Allowable tension loads in SDC C-F have been adjusted by 0.75 factor in accordance with ACI 318-11 Section D.3.3.4.4.

* See page 12 for an explanation of the load table icons.

ET-HP® Design Information — Concrete

ET-HP® Allowable Tension Loads for
Threaded Rod Anchors in Normal-Weight Concrete

Rod Dia. in. (mm)	Drill Bit Dia. in.	Embed. Depth in. (mm)	Critical Edge Dist. in. (mm)	Critical Spacing Dist. in. (mm)	Tension Load Based on Bond Strength			Tension Load Based on Steel Strength

7/8 (22.2)	1	7 3/4 (197)	11 5/8 (295)	31 (787)	43,596 (193.9)	1,130 (5.0)	10,900 (48.5)	11,500 (51.2)	24,785 (110.2)	16,860 (75.0)
1 (25.4)	1 1/8	9 (229)	13 1/2 (343)	36 (914)	47,333 (210.5)	1,243 (5.5)	11,835 (52.6)	15,025 (66.8)	32,380 (144.0)	22,020 (97.9)
1 1/8 (28.6)	1 1/4	10 1/8 (257)	15 1/4 (387)	40 1/2 (1029)	61,840 (275.1)	—	15,460 (68.8)	19,025 (84.6)	41,000 (182.4)	27,880 (124.0)
1 1/4 (31.8)	1 3/8	11 1/4 (286)	16 7/8 (429)	45 (1143)	78,748 (350.3)	4,738 (21.1)	19,685 (87.6)	23,490 (104.5)	50,620 (225.2)	34,420 (153.1)

1. Allowable load must be the lesser of the bond or steel strength.
2. The allowable loads listed under allowable bond are based on a safety factor of 4.0.
3. Refer to allowable load-adjustment factors for spacing and edge distance on pages 84 and 85.
4. Refer to in-service temperature sensitivity chart below for allowable load adjustment for temperature.

5. Anchors are permitted to be used within fire-resistive construction, provided the anchors resist wind or seismic loads only. For use in fire-resistive construction, the anchors can also be permitted to be used to resist gravity loads, provided special consideration has been given to fire-exposure conditions.
6. Anchors are not permitted to resist tension forces in overhead or wall installations unless proper consideration is given to fire-exposure and elevated-temperature conditions.

In-Service Temperature Sensitivity

Base Material Temperature		Percent Allowable Load
°F	°C	
40	4	100%
70	21	100%
110	43	100%
135	57	85%
150	66	69%

1. Refer to temperature-sensitivity chart for allowable bond strength reduction for temperature. See page 319 for more information.
2. Percent allowable load may be linearly interpolated for intermediate base material temperatures.
3. °C = (°F-32) / 1.8

ET-HP® Design Information — Masonry

ET-HP® Allowable Tension and Shear Loads for Threaded Rod and Rebar in the Face of Fully Grouted CMU Wall Construction^{1, 3, 4, 5, 6, 8, 9, 10, 11, 12}

Diameter (in.) or Rebar Size No.	Drill Bit Diameter (in.)	Minimum Embedment ² (in.)	Allowable Load Based on Bond Strength ⁷ (lb.)	
			Tension Load	Shear Load
Threaded Rod Installed in the Face of CMU Wall				
3/8	1/2	3 3/8	1,425	845
1/2	5/8	4 1/2	1,425	1,470
5/8	3/4	5 5/8	1,560	1,835
3/4	7/8	6 1/2	1,560	2,050
Rebar Installed in the Face of CMU Wall				
#3	1/2	3 3/8	1,275	1,335
#4	5/8	4 1/2	1,435	1,355
#5	3/4	5 5/8	1,550	1,355

1. Allowable load shall be the lesser of the bond values shown in this table and steel values, shown on page 83.
2. Embedment depth shall be measured from the outside face of masonry wall.
3. Critical and minimum edge distance and spacing shall comply with the information on page 82. Figure 2 on page 82 illustrates critical and minimum edge and end distances.
4. Minimum allowable nominal width of CMU wall shall be 8 inches. The minimum allowable member thickness shall be no less than 1 1/2 times the actual anchor embedment.
5. No more than one anchor shall be permitted per masonry cell.
6. Anchors shall be permitted to be installed at any location in the face of the fully grouted masonry wall construction (cell, web, bed joint), except anchors shall not be installed within 1 1/2 inches of the head joint, as show in Figure 2 on page 82.
7. Tabulated allowable load values are for anchors installed in fully grouted masonry walls.
8. Tabulated allowable loads are based on a safety factor of 5.0.
9. Tabulated allowable load values shall be adjusted for increased base material temperatures in accordance with Figure 1 below, as applicable.
10. Threaded rod and rebar installed in fully grouted masonry walls with ET-HP® are permitted to resist dead, live, seismic and wind loads.
11. Threaded rod shall meet or exceed the tensile strength of ASTM F1554, Grade 36 steel, which is 58,000 psi.
12. For installations exposed to severe, moderate or negligible exterior weathering conditions, as defined in Figure 1 of ASTM C62, allowable tension loads shall be multiplied by 0.80.

Figure 1. Load capacity based on in-service temperature for ET-HP® epoxy adhesive in the face of fully grouted CMU wall construction

* See page 12 for an explanation of the load table icons.

- Edge distance (C_{cr} or C_{min}) is the distance measured from anchor centerline to edge or end of CMU masonry wall. Refer to Figure 2 below for an illustration showing critical and minimum edge and end distances.
- Anchor spacing (S_{cr} or S_{min}) is the distance measured from centerline to centerline of two anchors.
- Critical edge distance, C_{cr} , is the least edge distance at which tabulated allowable load of an anchor is achieved where a load reduction factor equals 1.0 (no load reduction).
- Minimum edge distance, C_{min} , is the least edge distance where an anchor has an allowable load capacity which shall be determined by multiplying the allowable loads assigned to anchors installed at critical edge distance, C_{cr} , by the load reduction factors shown above.
- Critical spacing, S_{cr} , is the least anchor spacing at which tabulated allowable load of an anchor is achieved such that anchor performance is not influenced by adjacent anchors.
- Minimum spacing, S_{min} , is the least spacing where an anchors has an allowable load capacity, which shall be determined by multiplying the allowable loads assigned to anchors installed at critical spacing distance, S_{cr} , by the load reduction factors shown above.
- Reduction factors are cumulative. Multiple reduction factors for more than one spacing or edge or end distance shall be calculated separately and multiplied.
- Load reduction factor for anchors loaded in tension or shear with edge distances between critical and minimum shall be obtained by linear interpolation.
- Load reduction factor for anchors loaded in tension with spacing between critical and minimum shall be obtained by linear interpolation.
- Perpendicular shear loads act towards the edge or end. Parallel shear loads act parallel to the edge or end (see Figure 3 below). Perpendicular and parallel shear load reduction factors are cumulative when the anchor is located between the critical minimum edge and end distance.

Figure 2. Allowable anchor placement in grouted CMU face shell

Figure 3. Anchor placement in grouted CMU mortar "T" joint

- Direction of Shear Load A is parallel to edge of wall and perpendicular to end of wall.
- Direction of Shear Load B is parallel to end of wall and perpendicular to edge of wall.

* See page 12 for an explanation of the load table icons.

ET-HP® Design Information — Masonry

ET-HP® Allowable Tension and Shear Loads — Threaded Rod Based on Steel Strength¹

Threaded Rod Diameter (in.)	Tensile Stress Area (in. ²)	Tension Load Based on Steel Strength ² (lb.)				Shear Load Based on Steel Strength ² (lb.)			
		ASTM F1554 Grade 36 ⁴	ASTM A193 Grade B7 ⁶	Stainless Steel		ASTM F1554 Grade 36 ⁴	ASTMA 193 Grade B7 ⁶	Stainless Steel	
				ASTM A193 Grade B6 ⁵	ASTM A193 Grades B8 and B8M ⁷			ASTM A193 Grade B6 ⁵	ASTM A193 Grades B8 and B8M ⁷
3/8	0.078	1,495	3,220	2,830	1,930	770	1,660	1,460	995

3/4	0.334	6,395	13,780	12,125	8,265	3,295	7,100	6,245	4,260

- Allowable load shall be the lesser of bond values given on page 81 and steel values in the table above.
- Allowable Tension Steel Strength is based on the following equation: $F_v = 0.33 \times F_u \times \text{Tensile Stress Area}$.
- Allowable Shear Steel Strength is based on the following equation: $F_v = 0.17 \times F_u \times \text{Tensile Stress Area}$.
- Minimum specified tensile strength ($F_u = 58,000$ psi) of ASTM F1554, Grade 36 used to calculate allowable steel strength.
- Minimum specified tensile strength ($F_u = 110,000$ psi) of ASTM A193, Grade B6 used to calculate allowable steel strength.
- Minimum specified tensile strength ($F_u = 125,000$ psi) of ASTM A193, Grade B7 used to calculate allowable steel strength.
- Minimum specified tensile strength ($F_u = 75,000$ psi) of ASTM A193, Grades B8 and B8M used to calculate allowable steel strength.

ET-HP® Allowable Tension and Shear Loads — Deformed Reinforcing Bar Based on Steel Strength¹

Rebar Size	Tensile Stress Area (in. ²)	Tension Load (lb.)		Shear Load (lb.)	
		Based on Steel Strength		Based on Steel Strength	
		ASTM A615 Grade 40 ²	ASTM A615 Grade 60 ³	ASTM A615 Grade 40 ^{4,5}	ASTM A615 Grade 60 ^{4,6}
#3	0.11	2,200	2,640	1,310	1,685
#4	0.20	4,000	4,800	2,380	3,060
#5	0.31	6,200	7,400	3,690	4,745

- Allowable load shall be the lesser of bond values given on page 81 and steel values in the table above.
- Allowable Tension Steel Strength is based on AC58 Section 3.3.3 (20,000 psi x tensile stress area) for Grade 40 rebar.
- Allowable Tension Steel Strength is based on AC58 Section 3.3.3 (24,000 psi x tensile stress area) for Grade 60 rebar.
- Allowable Shear Steel Strength is based on AC58 Section 3.3.3 ($F_v = 0.17 \times F_u \times \text{Tensile Stress Area}$).
- $F_u = 70,000$ psi for Grade 40 rebar.
- $F_u = 90,000$ psi for Grade 60 rebar.

ET-HP® Allowable Tension and Shear Loads for Installations in Unreinforced Brick Masonry Walls — Minimum URM Wall Thickness is 13" (3 wythes thick)

- Threaded rods must comply with ASTM F1554 Grade 36 minimum.
- All holes are drilled with a 1"-diameter carbide-tipped drill bit with the drill set in the rotation-only mode.
- The unreinforced brick walls must have a minimum thickness of 13 inches (three wythes of brick).
- The allowable load is applicable only where in-place shear tests indicate minimum net mortar strength of 50 psi.
- The allowable load for Configuration B and C anchors subjected to a combined tension and shear load is determined by assuming a straight-line relationship between allowable tension and shear.
- The anchors installed in unreinforced brick walls are limited to resisting seismic or wind forces only.
- Configuration A has a straight threaded rod or rebar embedded 8 inches into the wall with a 3/8"-diameter by 8-inch-long screen tube (part # ETS758 or ETS758P). This configuration is designed to resist shear loads only.
- Configuration B has a 3/4" threaded rod bent and installed at a 22.5-degree angle and installed 13 inches into the wall, to within 1-inch (maximum) of the exterior wall surface. This configuration is designed to resist tension and shear loads. The pre-bent threaded rod is installed with a 3/8" diameter by 13-inch-long screen tube (part # ETS7513 or ETS7513P).
- Configuration C is designed to resist tension and shear forces. It consists of a 5/8"-diameter, ASTM F1554 Grade 36 threaded rod and an 8"-long sleeve (part # AST800) and a 3/8"-diameter by 8-inch-long screen tube (part # ETS758). The steel sleeve has a plastic plug in one end. A 6" by 6" by 3/8" thick ASTM A 36 steel plate is located on the back face of the wall.
- Special inspection requirements are determined by local jurisdiction and must be confirmed by the local building official.
- Refer to in-service temperature sensitivity chart for allowable load adjustment for temperature.

* See page 12 for an explanation of the load table icons.

Configuration A (Shear)

Configuration B (Tension & Shear)

Configuration C (Tension & Shear)

Installation Instructions for Configuration C

- Drill hole perpendicular to the wall to a depth of 8" with a 1"-diameter carbide-tipped drill bit (rotation-only mode).
- Clean hole with oil-free compressed air and a nylon brush.
- Fill 8" steel screen tube with mixed adhesive and insert into hole.
- Insert steel sleeve slowly into screen tube (adhesive will displace).
- Allow adhesive to cure (see cure schedule).
- Drill through plastic plug in (inside) end of steel sleeve with 5/8" bit.
- Drill completely through the wall with 5/8" carbide-tipped concrete drill bit (rotation-only mode).
- Insert 5/8" rod through hole and attach metal plate and nut.

ET-HP® Design Information — Concrete

ET-HP® Allowable Load-Adjustment Factors in Normal-Weight Concrete:
Edge Distance, Tension and Shear Loads

How to use these charts

1. The following tables are for reduced edge distance.
2. Locate the anchor size to be used for either a tension and/or shear load application.
3. Locate the embedment (E) at which the anchor is to be installed.
4. Locate the edge distance (c_{act}) at which the anchor is to be installed.

5. The load-adjustment factor (f_c) is the intersection of the row and column.
6. Multiply the allowable load by the applicable load-adjustment factor.
7. Reduction factors for multiple edges are multiplied together.
8. Adjustment factors do not apply to allowable steel strength values.
9. Adjustment factors are to be applied to allowable tension load based on bond strength values or allowable Shear Load Based on Concrete Edge Distance values only.

Edge Distance Tension (f_c)

1. E = Embedment depth (inches).
2. c_{act} = actual edge distance at which anchor is installed (inches).
3. c_{cr} = critical edge distance for 100% load (inches).
4. c_{min} = minimum edge distance for reduced load (inches).

5. f_c = adjustment factor for allowable load at actual edge distance.
6. f_{ccr} = adjustment factor for allowable load at critical edge distance. f_{ccr} is always = 1.00.
7. f_{cmin} = adjustment factor for allowable load at minimum edge distance.
8. $f_c = f_{cmin} + [(1 - f_{cmin})(c_{act} - c_{min}) / (c_{cr} - c_{min})]$.

* See page 12 for an explanation of the load table icons.

ET-HP® Design Information — Concrete

ET-HP® Allowable Load-Adjustment Factors in Normal-Weight Concrete: Spacing, Tension and Shear Loads

How to use these charts

- The following tables are for reduced spacing.
- Locate the anchor size to be used for either a tension and/or shear load application.
- Locate the embedment (E) at which the anchor is to be installed.
- Locate the spacing (S_{act}) at which the anchor is to be installed.
- The load-adjustment factor (f_s) is the intersection of the row and column.
- Multiply the allowable load by the applicable load-adjustment factor.
- Reduction factors for multiple spacings are multiplied together.
- Adjustment factors do not apply to allowable steel strength values.
- Adjustment factors are to be applied to allowable Tension Load Based on Bond Strength values or allowable Shear Load Based on Concrete Edge Distance values only.

Spacing Tension (f_s)

- E = Embedment depth (inches).
- S_{act} = actual spacing distance at which anchors are installed (inches).
- S_{cr} = critical spacing distance for 100% load (inches).
- S_{min} = minimum spacing distance for reduced load (inches).
- f_s = adjustment factor for allowable load at actual spacing distance.
- $f_{s_{cr}}$ = adjustment factor for allowable load at critical spacing distance. $f_{s_{cr}}$ is always = 1.00.
- $f_{s_{min}}$ = adjustment factor for allowable load at minimum spacing distance.
- $f_s = f_{s_{min}} + [(1 - f_{s_{min}}) (S_{act} - S_{min}) / (S_{cr} - S_{min})]$.

* See page 12 for an explanation of the load table icons.

AT Acrylic Adhesive

AT is a high-strength, acrylic-based adhesive anchoring system, formulated for use as a high-strength anchor-grouting material in a wide range of temperature conditions. It is a two-part system, with the resin and initiator being simultaneously dispensed and mixed through the mixing nozzle.

Features

- Code listed under the IBC/IRC for URM per ICC-ES ESR-1958
- Cure times – 24 hours at 0°F, 1 hour at 60°F
- Non-sag gel formulation ideal for horizontal, vertical and overhead applications
- Easy hole-cleaning procedure – no power-brushing required
- Suitable for use in damp or wet anchor sites
- When properly mixed, adhesive will be a uniform gray color
- Available in 9.6 oz., 12.5 oz. and 30 oz. cartridges for application versatility
- Manufactured in the USA using global materials

Applications

- Threaded rod anchoring and rebar doweling into concrete, masonry and URM (red brick)
- Multiple DOT listings – refer to www.strongtie.com/DOT for current approvals

Codes: ICC-ES ESR-1958 (URM); AASHTO M-235 and ASTM C881 (Type I and IV, Grade 3, Class A, B and C – except AT adhesive is a non-epoxy formulated for fast cure time); multiple DOT listings (refer to strongtie.com/DOT).

Chemical Resistance

See pages 320–321.

Installation and Application Instructions

(See also pages 124–127.)

- Surfaces to receive adhesive must be clean.
- Base material temperature must be 0°F or above at the time of installation.
- For information on installations below 0°F, contact Simpson Strong-Tie.
- Mixed material in nozzle can harden in 5–7 minutes at temperatures of 70°F and above.

Design Example

See page 324.

Suggested Specifications

See www.strongtie.com for more information.

AT Adhesive

AT Acrylic Adhesive

Test Criteria

Anchors installed with AT adhesive have been tested in accordance with ICC-ES *Acceptance Criteria for Anchors in Unreinforced Masonry Elements (AC60)*.

Property	Test Method	Result*
Consistency	ASTM C881	Non-sag/thixotropic paste
Heat deflection	ASTM D648	142°F (61°C)
Bond strength (moist cure, 60°F)	ASTM C882	2,960 psi (2 days) 3,567 psi (14 days)
Water absorption	ASTM D570	0.25% (24 hours)
Compressive yield strength (cured 60°F)	ASTM D695	10,930 psi (7 days)
Compressive modulus (cured 60°F)	ASTM D695	502,330 psi (7 days)
Shore D hardness	ASTM D2240	91
Gel time	ASTM C881	5 minutes
VOC	ASTM D2369	25 g/L
Shrinkage coefficient	ASTM D2566	0.004 in./in.

*Material and curing conditions: 73 ± 2°F, unless otherwise noted.

AT Adhesive Cartridge Systems

Model No.	Capacity (ounces)	Cartridge Type	Carton Quantity	Dispensing Tools	Mixing Nozzle
AT10	9.6	Single	12	CDT10S	AMN19Q
AT13	12.5	Side-by-side	10	ADT813S	
AT30	30	Side-by-side	5	ADT30S ADTA30CKT ADTA30P	

1. Cartridge estimation guidelines are available at www.strongtie.com/apps.
2. Detailed information on dispensing tools, mixing nozzles and other adhesive accessories is available on pages 128 through 135, or at www.strongtie.com.
3. Use only Simpson Strong-Tie® mixing nozzles in accordance with Simpson Strong-Tie instructions. Modification or improper use of mixing nozzle may impair AT adhesive performance.

In-Service Temperature Sensitivity

Base Material Temperature		Percent Allowable Load for $T_{inst} = 0^{\circ}\text{F}$	Percent Allowable Load for $T_{inst} \geq 70^{\circ}\text{F}$
°F	°C		
0	-18	100%	100%
32	0	100%	100%
70	21	100%	100%
110	43	82%	82%
135	57	74%	82%
150	66	38%	65%
180	82	22%	28%

1. Refer to in-service temperature sensitivity chart for allowable bond strength reduction for in-service temperature. See page 319.
2. T_{inst} is the base material temperature during installation and curing of the adhesive.
3. Percent allowable load for $T_{inst} = 0^{\circ}\text{F}$ (-18°C) is to be used for T_{inst} between 0°F (-18°C) and 70°F (21°C).
4. Percent allowable load may be linearly interpolated for intermediate base material in-service temperatures.
5. $^{\circ}\text{C} = (^{\circ}\text{F} - 32) / 1.8$

Cure Schedule

Base Material Temperature		Cure Time (hrs.)
°F	°C	
0	-18	24
25	-4	8
40	4	4
60	16	1
70	21	30 min.
100	38	20 min.

- Reference page 318 for oversize holes.
- Allowable load must be the lesser of the bond or steel strength.
- The allowable loads listed under allowable bond are based on a safety factor of 4.0.
- Refer to allowable load-adjustment factors for spacing and edge distance on pages 97, 99 and 100.
- Refer to in-service temperature sensitivity chart for allowable load adjustment for temperature.
- Anchors are permitted to be used within fire-resistive construction, provided the anchors resist wind or seismic loads only. For use in fire-resistive construction, the anchors can also be permitted to be used to resist gravity loads, provided special consideration has been given to fire-exposure conditions.
- Anchors are not permitted to resist tension forces in overhead or wall installations unless proper consideration is given to fire-exposure and elevated-temperature conditions.

* See page 12 for an explanation of the load table icons.

- Threaded rods must comply with ASTM F1554 Grade 36 minimum.
- Values for 6- and 8-inch wide concrete masonry units (CMU) with a minimum specified compressive strength of masonry, f'_m , at 28 days is 1500 psi.
- Embedment depth is measured from the outside face of the concrete masonry unit for installations through a face shell.
- Allowable loads may be increased 33 1/3% for short-term loading due to wind or seismic forces where permitted by code.
- Refer to in-service temperature sensitivity chart for allowable load adjustment for temperature.
- The tabulated allowable loads are based on a safety factor of 5.0.
- Anchors must be spaced a minimum distance of four times the anchor embedment.
- Shear load applied perpendicular to edge of CMU wall.
- Shear load applied parallel to edge of CMU wall.

1. Threaded rods must comply with ASTM F1554 Grade 36 minimum.
2. All holes are drilled with a 1" diameter carbide-tipped drill bit with the drill set in the rotation-only mode.
3. The unreinforced brick walls must have a minimum thickness of 13 inches (three wythes of brick).
4. The allowable load is applicable only where in-place shear tests indicate minimum net mortar strength of 50 psi.
5. The allowable load for Configuration B and C anchors subjected to a combined tension and shear load is determined by assuming a straight-line relationship between allowable tension and shear.
6. The anchors installed in unreinforced brick walls are limited to resisting seismic or wind forces only.
7. Configuration A has a straight threaded rod or rebar embedded 8 inches into the wall with a 3/4" diameter by 8-inch long screen tube (part # ATS758 or ATS758P). This configuration is designed to resist shear loads only.
8. Configuration B has a 3/4" threaded rod bent and installed at a 22.5-degree angle and installed 13 inches into the wall, to within 1-inch (maximum) of the exterior wall surface. This configuration is designed to resist tension and shear loads. The pre-bent threaded rod is installed with a 3/4" diameter by 13-inch long screen tube (part # ATS7513 or ATS7513P).
9. Configuration C is designed to resist tension and shear forces. It consists of a 5/8" diameter, ASTM F1554 Grade 36 threaded rod and an 8" long steel sleeve (part # AST800) and a 3/4" diameter by 8-inch long screen tube (part # ATS758). The steel sleeve has a plastic plug in one end. A 6" by 6" by 5/8" thick ASTM A 36 steel plate is located on the back face of the wall.
10. Special inspection requirements are determined by local jurisdiction and must be confirmed by the local building official.
11. Refer to in-service temperature sensitivity chart for allowable load adjustment for temperature.

Configuration A (Shear)

Configuration B (Tension & Shear)

Configuration C (Tension & Shear)

1. Threaded rods must comply with ASTM F1554 Grade 36 minimum.
2. The tabulated allowable loads are based on a safety factor of 5.0 for installations under the IBC and IRC.
3. Edge distances may be reduced to 4" with a corresponding 37% reduction in tension capacity. Shear capacity is unaffected.
4. Values for 8-inch wide, lightweight, medium-weight and normal-weight concrete masonry units with min. compressive strength of 1,900 psi and 1 1/4" thick face shell.
5. Embedment depth is measured from the outside face of the concrete masonry unit.
6. Refer to in-service temperature sensitivity chart for allowable load adjustment for temperature.
7. Set drill to rotation-only mode when drilling into hollow CMU.

* See page 12 for an explanation of the load table icons.

Installation Instructions for Configuration C

1. Drill hole perpendicular to the wall to a depth of 8" with a 1" diameter carbide-tipped drill bit (rotation only mode).
2. Clean hole with oil-free compressed air and a nylon brush.
3. Fill 8" steel screen tube with mixed adhesive and insert into hole.
4. Insert steel sleeve slowly into screen tube (adhesive will displace).
5. Allow adhesive to cure (see cure schedule).
6. Drill through plastic plug in (inside) end of steel sleeve with 5/8" bit.
7. Drill completely through the wall with 5/8" carbide tipped concrete drill bit (rotation mode only).
8. Insert 5/8" rod through hole and attach metal plate and nut.

1. Threaded rods must comply with ASTM F1554 Grade 36 minimum.
2. Values are for 8-inch wide concrete masonry units CMU filled with concrete with minimum compressive strength of 2,500 psi and poured monolithically with the floor slab.
3. Center #5 rebar in CMU cell and concrete slab as shown.
4. The tabulated allowable loads are based on a safety factor of 5.0.

* See page 12 for an explanation of the load table icons.

AT Design Information — Concrete

AT Allowable Load Adjustment Factors in Normal-Weight Concrete: Edge Distance, Tension Load

How to use these charts

1. The following tables are for reduced edge distance.
2. Locate the anchor size to be used for either a tension and/or shear load application.
3. Locate the embedment (E) at which the anchor is to be installed.
4. Locate the edge distance (C_{act}) at which the anchor is to be installed.
5. The load-adjustment factor (f_c) is the intersection of the row and column.
6. Multiply the allowable load by the applicable load-adjustment factor.
7. Reduction factors for multiple edges are multiplied together.
8. Adjustment factors do not apply to allowable steel strength values.
9. Adjustment factors are to be applied to allowable tension load based on bond strength values only.

1. E = Embedment depth (inches).
2. C_{act} = actual edge distance at which anchor is installed (inches).
3. C_{cr} = critical edge distance for 100% load (inches).
4. C_{min} = minimum edge distance for reduced load (inches).
5. f_c = adjustment factor for allowable load at actual edge distance.
6. f_{ocr} = adjustment factor for allowable load at critical edge distance. f_{ocr} is always = 1.00.
7. f_{cmin} = adjustment factor for allowable load at minimum edge distance.
8. $f_c = f_{cmin} + [(1 - f_{cmin})(C_{act} - C_{min}) / (C_{cr} - C_{min})]$.

* See page 12 for an explanation of the load table icons.

AT Design Information — Concrete

AT Allowable Load Adjustment Factors in Normal-Weight Concrete: Edge Distance, Shear Load

How to use these charts

- The following tables are for reduced edge distance.
- Locate the anchor size to be used for either a tension and/or shear load application.
- Locate the embedment (E) at which the anchor is to be installed.
- Locate the edge distance (C_{act}) at which the anchor is to be installed.
- The load-adjustment factor (f_d) is the intersection of the row and column.
- Multiply the allowable load by the applicable load-adjustment factor.
- Reduction factors for multiple edges are multiplied together.
- Adjustment factors do not apply to allowable steel strength values.
- Adjustment factors are to be applied to allowable shear load based on concrete edge distance values only.

- E = Embedment depth (inches).
- C_{act} = actual edge distance at which anchor is installed (inches).
- C_{cr} = critical edge distance for 100% load (inches).
- C_{min} = minimum edge distance for reduced load (inches).
- f_c = adjustment factor for allowable load at actual edge distance.
 $f_{c_{cr}}$ = adjustment factor for allowable load at critical edge distance.
 $f_{c_{cr}}$ is always = 1.00.
- f_{cmin} = adjustment factor for allowable load at minimum edge distance.
- $f_c = f_{cmin} + [(1 - f_{cmin}) (C_{act} - C_{min}) / (C_{cr} - C_{min})]$.

* See page 12 for an explanation of the load table icons.

AT Design Information — Concrete

AT Allowable Load Adjustment Factors in Normal-Weight Concrete: Spacing, Tension Load

How to use these charts

1. The following tables are for reduced spacing.
2. Locate the anchor size to be used for either a tension and/or shear load application.
3. Locate the embedment (E) at which the anchor is to be installed.
4. Locate the spacing (s_{act}) at which the anchor is to be installed.
5. The load-adjustment factor (f_s) is the intersection of the row and column.
6. Multiply the allowable load by the applicable load-adjustment factor.
7. Reduction factors for multiple spacings are multiplied together.
8. Adjustment factors do not apply to allowable steel strength values
9. Adjustment factors are to be applied to allowable tension load based on bond strength values only.

AT Allowable Load Adjustment Factors in Sand-Lightweight Concrete: Edge Distance, Tension and Shear Loads

How to use these charts

1. The following tables are for reduced edge distance only.
2. Locate the anchor size to be used for either a tension and/or shear load application.
3. Locate the embedment (E) at which the anchor is to be installed.
4. Locate the edge distance (C_{act}) at which the anchor is to be installed.
5. The load-adjustment factor (f_c) is the intersection of the row and column.
6. Multiply the allowable load by the applicable load-adjustment factor.
7. Reduction factors for multiple edges are multiplied together.
8. Adjustment factors do not apply to allowable steel strength values.
9. Adjustment factors are to be applied to allowable tension load based on bond strength values or allowable shear load based on concrete edge distance values only.

6. f_{ocr} = adjustment factor for allowable load at critical edge distance. f_{ocr} is always = 1.00.
7. f_{cmin} = adjustment factor for allowable load at minimum edge distance.
8. $f_c = f_{cmin} + [(1 - f_{cmin}) (C_{act} - C_{min}) / (C_{cr} - C_{min})]$.

* See page 12 for an explanation of the load table icons.

SET Epoxy Adhesive

SET is a high-strength, non-shrink, epoxy-based adhesive formulated for anchoring and doweling threaded rod and rebar. Resin and hardener are dispensed and mixed simultaneously through the mixing nozzle.

Features

- Code listed under the IBC/IRC for URM per ICC-ES ESR-1772
- Meets or exceeds the requirements of ASTM C881 specification for Type I and IV, Grade 3, Class C
- Cure times – 24 hours at 65°F, 72 hours at 40°F
- Easy hole-cleaning procedure – no power-brushing required
- Suitable for use in damp or wet anchor sites
- When properly mixed, adhesive will be a uniform gray color
- Available in 22 oz. and 56 oz. cartridges for application versatility
- Manufactured in the USA using global materials

Applications

- Threaded rod anchoring and rebar doweling into concrete, masonry and URM (red brick)
- Pick-proof sealant around doors, windows and fixtures
- Paste-over for crack injection preparation
- Bonding hardened concrete to hardened concrete
- CalTrans and multiple DOT listings; refer to www.strongtie.com/DOT

Codes: ICC-ES ESR-1772 (unreinforced masonry); Florida FL15730.5; AASHTO M-235 and ASTM C881 (Type I and IV, Grade 3, Class C); CalTrans Approved; Multiple DOT listings; NSF/ANSI Standard 61 (216 in.²/1,000 gal.)

Chemical Resistance

See pages 320–321.

Installation and Application Instructions

(See also pages 124–127.)

- Surfaces to receive epoxy must be clean.
- Base material temperature must be 40°F or above at the time of installation. For best results, material should be 70°–80°F at time of application.
- To warm cold material, store cartridges in a warm, uniformly heated area or storage container. Do not immerse cartridges in water to facilitate warming.
- Mixed material in nozzle can harden in 30 minutes at temperatures of 70°F and above.

Design Example

See page 324.

Suggested Specifications

See www.strongtie.com for more information.

SET Adhesive

SET Epoxy Adhesive

Test Criteria

Anchors installed with SET adhesive have been tested in accordance with ICC-ES *Acceptance Criteria for Anchors in Unreinforced Masonry Elements (AC60)*.

Property	Test Method	Result*
Consistency	ASTM C881	Non-sag/thixotropic paste
Heat deflection temperature	ASTM D648	136°F (58°C)
Bond strength (moist cure)	ASTM C882	3,218 psi (2 days) 3,366 psi (14 days)
Water absorption	ASTM D570	0.11% (24 hours)
Compressive yield strength	ASTM D695	5,065 psi (24 hours) 12,650 psi (7 days)
Compressive modulus	ASTM D695	439,000 psi (7 days)
Shore D Durometer	ASTM D2240	81
Gel time (75°F)	ASTM C881	30 minutes – 60 gram mass 60 minutes – thin film
VOC	ASTM D2369	6 g/L

*Material and curing conditions: 73 ± 2°F, unless otherwise noted.

SET Cartridge System

Model No.	Capacity (ounces)	Cartridge Type	Carton Quantity	Dispensing Tools	Mixing Nozzle
SET22	22	Side-by-side	10	EDT22S, EDTA22CKT	EMN22i
SET22-N ⁴	22	Side-by-side	10	EDTA22P	EMN22i
SET56	56	Side-by-side	6	EDTA56P	EMN50

1. Cartridge estimation guidelines are available at www.strongtie.com/apps.
2. Detailed information on dispensing tools, mixing nozzles and other adhesive accessories is available on pages 128 through 135, or at www.strongtie.com.
3. Use only Simpson Strong-Tie® mixing nozzles in accordance with Simpson Strong-Tie instructions. Modification or improper use of mixing nozzle may impair SET adhesive performance.
4. One EMN22i mixing nozzle and one nozzle extension are supplied with each cartridge.

Cure Schedule

Base Material Temperature		Cure Time (hrs.)
°F	°C	
40	4	72
65	18	24
85	29	20
90	32	16

For water-saturated concrete (including damp and water-filled holes), the cure times must be doubled.

In-Service Temperature Sensitivity

Base Material Temperature		Percent Allowable Load
°F	°C	
40	4	100%
70	21	100%
110	43	100%
135	57	75%
150	66	44%
180	82	20%

1. Refer to temperature sensitivity chart for allowable bond strength reduction for temperature. See page 319 for more information.
2. Percent allowable load may be linearly interpolated for intermediate base material temperatures.
3. °C = (°F-32) / 1.8

Adhesive Anchors

- Allowable load must be the lesser of the bond or steel strength.
- The allowable loads listed under allowable bond are based on a safety factor of 4.0.
- Refer to allowable load-adjustment factors for spacing and edge distance on pages 116 and 118.
- Refer to in-service temperature sensitivity chart for allowable load adjustment for temperature.
- Anchors are permitted to be used within fire-resistive construction, provided the anchors resist wind or seismic loads only. For use in fire-resistive construction, the anchors can also be permitted to be used to resist gravity loads, provided special consideration has been given to fire-exposure conditions.
- Anchors are not permitted to resist tension forces in overhead or wall installations unless proper consideration is given to fire-exposure and elevated-temperature conditions.
- Allowable load based on bond strength may be interpolated for concrete compressive strengths between 2,000 psi and 4,000 psi.

* See page 12 for an explanation of the load table icons.

SET Allowable Tension Loads for Threaded Rod Anchors in Normal-Weight Concrete Stemwall

Rod Dia. in. (mm)	Drill Bit Dia. in.	Embed. Depth in. (mm)	Stemwall Width in. (mm)	Min. Edge Dist. in. (mm)	Min. End Dist. in. (mm)	Tension Load Based on Bond Strength		Tension Load Based on Steel Strength	
						$f'_c \geq 2,500$ psi (17.2 MPa) Concrete			F1554 Grade 36
						Ultimate lb. (kN)	Allowable lb. (kN)	Allowable lb. (kN)	
5/8 (15.9)	3/4	10 (254.0)	6 (152.4)	1 3/4 (44.5)	5 (127.0)	13,634 (60.6)	3,410 (15.2)	5,875 (26.1)	
7/8 (22.2)	1	15 (381.0)	8 (203.2)	1 3/4 (44.5)	5 (127.0)	22,664 (100.8)	5,665 (25.2)	11,500 (51.2)	

1. Allowable load must be the lesser of the bond or steel strength.
2. The allowable loads listed under allowable bond are based on a safety factor of 4.0.
3. Refer to in-service temperature sensitivity chart for allowable load adjustment for temperature.
4. Anchors are permitted to be used within fire-resistive construction, provided the anchors resist wind or seismic loads only. For use in fire-resistive construction, the anchors can also be permitted to be used to resist gravity loads, provided special consideration has been given to fire-exposure conditions.

Edge and end distances for threaded rod in concrete foundation stemwall corner installation

SET Allowable Shear Loads for Threaded Rod Anchors in Normal-Weight Concrete, Load Applied Parallel to Concrete Edge

Rod Dia. in. (mm)	Drill Bit Dia. in.	Embed. Depth in. (mm)	Min. Edge Dist. in. (mm)	Min. End Dist. in. (mm)	Shear Load Based on Concrete Edge Distance			Shear Load Based on Steel Strength
					$f'_c \geq 2,000$ psi (13.8 MPa) Concrete			F1554 Grade 36
					Ultimate lb. (kN)	Std. Dev. lb. (kN)	Allowable lb. (kN)	Allowable lb. (kN)
1/2 (12.7)	5/8	4 1/4 (108.0)	1 3/4 (44.5)	8 1/2 (219.9)	8,496 (37.8)	654 (2.9)	2,125 (9.5)	1,930 (8.6)
5/8 (15.9)	3/4	5 (127.0)	1 3/4 (44.5)	10 (254.0)	8,857 (39.4)	225 (1.0)	2,215 (9.9)	3,025 (13.5)

1. Allowable load must be the lesser of the load based on concrete edge distance, steel strength or wood bearing capacity.
2. The allowable loads based on concrete edge distance are based on a safety factor of 4.0.
3. Refer to allowable load-adjustment factors for spacing on page 119.
4. Refer to in-service temperature sensitivity chart for allowable load adjustment for temperature.
5. Anchors are permitted to be used within fire-resistive construction, provided the anchors resist wind or seismic loads only. For use in fire-resistive construction, the anchors can also be permitted to be used to resist gravity loads, provided special consideration has been given to fire-exposure conditions.

* See page 12 for an explanation of the load table icons.

1. Allowable load must be the lesser of the bond or steel strength.
2. The allowable loads listed under allowable bond are based on a safety factor of 4.0.
3. Refer to allowable load-adjustment factors for spacing and edge distance on pages 116 and 118.
4. Refer to in-service temperature sensitivity chart for allowable load adjustment for temperature.
5. Anchors are permitted to be used within fire-resistive construction, provided the anchors resist wind or seismic loads only. For use in fire-resistive construction, the anchors can also be permitted to be used to resist gravity loads, provided special consideration has been given to fire-exposure conditions.
6. Anchors are not permitted to resist tension forces in overhead or wall installations unless proper consideration is given to fire exposure and elevated-temperature conditions.
7. Allowable load based on bond strength may be interpolated for concrete compressive strengths between 2,000 psi and 4,000 psi.

* See page 12 for an explanation of the load table icons.

SET Design Information — Concrete

1. Threaded rods must comply with ASTM F1554 Grade 36 minimum.
2. Values for 8-inch wide concrete masonry units (CMU) with a minimum specified compressive strength of masonry, f'_m , at 28 days is 1500 psi.
3. Embedment depth is measured from the outside face of the concrete masonry unit.
4. Allowable loads may be increased 33⅓% for short-term loading due to wind forces or seismic forces where permitted by code.
5. Refer to in-service temperature sensitivity chart for allowable load adjustment for temperature.
6. The tabulated allowable loads are based on a safety factor of 5.0.
7. Refer to allowable load-adjustment factors for end distance, edge distance and spacing on page 121.

Figure 1

* See page 12 for an explanation of the load table icons.

SET Design Information — Masonry

SET Allowable Tension and Shear Loads for Threaded Rod Anchors in 6- and 8-inch Lightweight, Medium-Weight and Normal-Weight Grout-Filled CMU — Anchor Installed in Cell Opening (Top of Wall)

					Ultimate lb. (kN)	Allowable lb. (kN)	Ultimate lb. (kN)	Allowable lb. (kN)
Anchor Installed in Face Shell with Simpson Strong-Tie® Epoxy Carbon-Steel Screen Tube								
5/8 (15.9)	7/8	3 1/2 (88.9)	4 (101.6)	4 5/8 (117.5)	881 (3.9)	175 (0.8)	1,440 (6.4)	290 (1.3)
3/4 (19.1)	1	3 1/2 (88.9)	4 (101.6)	4 5/8 (117.5)	—	175 (0.8)	—	290 (1.3)

1. Threaded rods must comply with ASTM F1554 Grade 36 minimum.
2. Values for 8-inch wide concrete masonry units (CMU) with a minimum specified compressive strength of masonry, f'm, at 28 days is 1500 psi.
3. Embedment depth is measured from the outside face of the concrete masonry unit for installations through a face shell.
4. Allowable loads may not be increased for short-term loading due to wind forces or seismic forces.
5. Refer to in-service temperature sensitivity chart for allowable load adjustment for temperature.
6. The tabulated allowable loads are based on a safety factor of 5.0.
7. Anchors must be spaced a minimum distance of four times the anchor embedment.
8. Screen tubes not for use with SET1.7KTA.
9. Set drill to rotation-only mode when drilling into hollow CMU.

Figure 3
Anchor installed in face shell
with screen tube in hollow cell

* See page 12 for an explanation of the load table icons.

SET Design Information — Masonry

SET Allowable Tension and Shear Loads for Installations in Unreinforced Brick Masonry Walls — Minimum URM Wall Thickness is 13" (3 wythes thick)

Rod/Rebar Dia./Size in. (mm)	Drill Bit Dia. in.	Embed. Depth in. (mm)	Min. Edge/End Dist. in. (mm)	Min. Vertical Spacing Dist. in. (mm)	Min. Horiz. Spacing Dist. in. (mm)	Tension Load Based on URM Strength Allowable lb. (kN)	Shear Load Based on URM Strength Allowable lb. (kN)
Configuration A (Simpson Strong-Tie® ETS or ETSP Screen Tube Required)							
3/4 (19.1)	1	8 (203)	16 (406)	16 (406)	16 (406)	—	1,000 (4.4)
#5 (15.9)	1	8 (203)	16 (406)	16 (406)	16 (406)	—	750 (3.3)
#6 (19.1)	1	8 (203)	16 (406)	16 (406)	16 (406)	—	1,000 (4.4)
Configuration B (Simpson Strong-Tie ETS or ETSP Screen Tube Required)							
3/4 (19.1)	1	13 (330)	16 (406)	16 (406)	16 (406)	1,200 (5.3)	1,000 (4.4)
Configuration C (Simpson Strong-Tie ETS Screen Tube and AST Steel Sleeve Required)							
5/8 (15.9)	1	**	16 (406)	16 (406)	16 (406)	1,200 (5.3)	750 (3.3)

1. Threaded rods must comply with ASTM F1554 Grade 36 minimum.
2. All holes are drilled with a 1" diameter carbide-tipped drill bit with the drill set in the rotation-only mode.
3. The unreinforced brick walls must have a minimum thickness of 13 inches (three wythes of brick).
4. The allowable load is applicable only where in-place shear tests indicate minimum net mortar strength of 50 psi. For installations using a wet diamond core-drill bit, the allowable load is applicable only where in-place shear tests indicate minimum net mortar strength of 325 psi.
5. The allowable load for Configuration B and C anchors subjected to a combined tension and shear load is determined by assuming a straight-line relationship between allowable tension and shear.
6. The anchors installed in unreinforced brick walls are limited to resisting seismic or wind forces only.
7. Configuration A has a straight threaded rod or rebar embedded 8 inches into the wall with a 3/2" diameter by 8-inch long screen tube (part # ETS758 or ETS758P). This configuration is designed to resist shear loads only.
8. Configuration B has a 3/4" threaded rod bent and installed at a 22.5-degree angle and installed 13 inches into the wall, to within 1-inch (maximum) of the exterior wall surface. This configuration is designed to resist tension and shear loads. The pre-bent threaded rod is installed with a 3/2" diameter by 13-inch long screen tube (part # ETS7513 or ETS7513P).
9. Configuration C is designed to resist tension and shear forces. It consists of a 5/8" diameter, ASTM F1554 Grade 36 threaded rod and an 8" long sleeve (part # AST800) and a 3/2" diameter by 8-inch long screen tube (part # ETS758). The steel sleeve has a plastic plug in one end. A 6" by 6" by 3/8" thick ASTM A 36 steel plate is located on the back face of the wall.
10. Special inspection requirements are determined by local jurisdiction and must be confirmed by the local building official.
11. Refer to in-service temperature sensitivity chart for allowable load adjustment for temperature.
12. Screen tubes not for use with SET1.7KTA.

Configuration A (Shear)

Configuration B (Tension & Shear)

Configuration C (Tension & Shear)

SET Allowable Tension and Shear Loads for Threaded Rod Anchors in Lightweight, Medium-Weight and Normal-Weight Hollow CMU

Rod Dia. in. (mm)	Drill Bit Dia. in.	Embed. Depth in. (mm)	Critical Edge Dist. in. (mm)	Critical Spacing Dist. in. (mm)	8-inch Hollow CMU Allowable Loads Based on CMU Strength			
					Tension		Shear	
					Ultimate lb. (kN)	Allowable lb. (kN)	Ultimate lb. (kN)	Allowable lb. (kN)
Anchor Installed in Face Shell with Simpson Strong-Tie ETSP (Plastic) Screen Tube								
3/8 (9.5)	5/16	3 1/2 (88.9)	12 (305)	8 (203)	1,500 (6.7)	300 (1.3)	1,280 (5.7)	255 (1.1)
1/2 (12.7)	3/4	3 1/2 (88.9)	12 (305)	8 (203)	1,500 (6.7)	300 (1.3)	1,280 (5.7)	255 (1.1)
5/8 (15.9)	7/8	3 1/2 (88.9)	12 (305)	8 (203)	1,500 (6.7)	300 (1.3)	1,380 (6.1)	275 (1.2)

1. Threaded rods must comply with ASTM F1554 Grade 36 minimum.
2. The tabulated allowable loads are based on a safety factor of 5.0
3. Edge distances may be reduced to 4" with a corresponding 32% reduction in tension capacity. Shear capacity is unaffected.
4. Values for 8-inch wide, lightweight, medium-weight and normal-weight concrete masonry units with min. compressive strength of 1,900 psi and 1 1/4" thick face shell.
5. Embedment depth is measured from the outside face of the concrete masonry unit.
6. Refer to in-service temperature sensitivity chart for allowable load adjustment for temperature.
7. Allowable loads may not be increased for short-term loading due to wind or seismic forces. Wall design must satisfy applicable design standards and be capable of withstanding applied loads.
8. Screen tubes not for use with SET1.7KTA.
9. Set drill to rotation-only mode when drilling into hollow CMU.

Installation Instructions for Configuration C

1. Drill hole perpendicular to the wall to a depth of 8" with a 1" diameter carbide-tipped drill bit (rotation only mode).
2. Clean hole with oil-free compressed air and a nylon brush.
3. Fill 8" steel screen tube with mixed adhesive and insert into hole.
4. Insert steel sleeve slowly into screen tube (adhesive will displace).
5. Allow adhesive to cure (see cure schedule).
6. Drill through plastic plug in (inside) end of steel sleeve with 5/8" bit.
7. Drill completely through the wall with 5/8" carbide tipped concrete drill bit (rotation mode only).
8. Insert 5/8" rod through hole and attach metal plate and nut.

* See page 12 for an explanation of the load table icons.

SET Design Information — Masonry

SET Allowable Tension Loads for Threaded Rod Anchors in 8" Lightweight, Medium-Weight and Normal-Weight CMU Chair Blocks Filled with Normal-Weight Concrete

Rod Dia. in. (mm)	Drill Bit Dia. in.	Min. Embed. Depth in. (mm)	Min. Edge Dist. in. (mm)	Critical Spacing Dist. in. (mm)	8-inch Concrete-Filled CMU Chair Block	
					Allowable Tension Loads Based on CMU Strength	
					Ultimate lb. (kN)	Allowable lb. (kN)
1/2 (12.7)	5/8	4 1/2 (114)	1 3/4 (44.5)	18 (457)	4,810 (21.4)	960 (4.3)
		7 (178)	1 3/4 (44.5)	28 (711)	7,715 (34.3)	1,545 (6.9)
5/8 (15.9)	3/4	4 1/2 (114)	1 3/4 (44.5)	18 (457)	4,955 (22.0)	990 (4.4)

		12 (305)	1 3/4 (44.5)	48 (1,219)	12,200 (54.4)	2,440 (10.9)

1. Threaded rods must comply with ASTM F1554 Grade 36 minimum.
2. Values are for 8-inch-wide concrete masonry units CMU filled with concrete with minimum compressive strength of 2,500 psi and poured monolithically with the floor slab.
3. Center #5 rebar in CMU cell and concrete slab as shown.
4. The tabulated allowable loads are based on a safety factor of 5.0.

* See page 12 for an explanation of the load table icons.

SET Design Information — Concrete

SET Allowable Load-Adjustment Factors in Normal-Weight Concrete: Edge Distance, Tension Load

How to use these charts

1. The following tables are for reduced edge distance.
2. Locate the anchor size to be used for either a tension and/or shear load application.
3. Locate the embedment (E) at which the anchor is to be installed.
4. Locate the edge distance (c_{act}) at which the anchor is to be installed.
5. The load-adjustment factor (f_c) is the intersection of the row and column.
6. Multiply the allowable load by the applicable load-adjustment factor.
7. Reduction factors for multiple edges are multiplied together.
8. Adjustment factors do not apply to allowable steel strength values.
9. Adjustment factors are to be applied to allowable tension load based on bond strength values only.

SET Design Information — Concrete

SET Allowable Load-Adjustment Factors in Normal-Weight Concrete: Edge Distance, Shear Load

How to use these charts

- The following tables are for reduced edge distance.
- Locate the anchor size to be used for either a tension and/or shear load application.
- Locate the embedment (E) at which the anchor is to be installed.
- Locate the edge distance (c_{act}) at which the anchor is to be installed.
- The load-adjustment factor (f_c) is the intersection of the row and column.
- Multiply the allowable load by the applicable load-adjustment factor.
- Reduction factors for multiple edges are multiplied together.
- Adjustment factors do not apply to allowable steel strength values.
- Adjustment factors are to be applied to allowable shear load based on concrete edge distance values only.

SET Design Information — Concrete

SET Allowable Load-Adjustment Factors in Normal-Weight Concrete: Spacing, Tension Load

How to use these charts

- The following tables are for reduced spacing.
- Locate the anchor size to be used for either a tension and/or shear load application.
- Locate the embedment (E) at which the anchor is to be installed.
- Locate the spacing (s_{act}) at which the anchor is to be installed.
- The load-adjustment factor (f_s) is the intersection of the row and column.
- Multiply the allowable load by the applicable load-adjustment factor.
- Reduction factors for multiple spacings are multiplied together.
- Adjustment factors do not apply to allowable steel strength values.
- Adjustment factors are to be applied to allowable tension load based on bond strength values only.

SET Design Information — Concrete

SET Allowable Load-Adjustment Factors in Sand-Lightweight Concrete: Edge Distance, Tension and Shear Loads

How to use these charts

- The following tables are for reduced edge distance only.
- Locate the anchor size to be used for either a tension and/or shear load application.
- Locate the embedment (E) at which the anchor is to be installed.
- Locate the edge distance (c_{act}) at which the anchor is to be installed.
- The load-adjustment factor (f_c) is the intersection of the row and column.
- Multiply the allowable load by the applicable load-adjustment factor.
- Reduction factors for multiple edges are multiplied together.
- Adjustment factors do not apply to allowable steel strength values.
- Adjustment factors are to be applied to allowable tension load based on bond strength values or allowable shear load based on concrete edge distance values only.

SET Design Information — Masonry

SET Allowable Load-Adjustment Factors in Face of Wall Installation in 8" Grout-Filled CMU: End/Edge Distance and Spacing, Tension and Shear Loads

How to use these charts

1. The following tables are for reduced end and edge distance and spacing.
2. Locate the anchor size to be used for either a tension and/or shear load application.
3. Locate the embedment (E) at which the anchor is to be installed.
4. Locate the end or edge distance (C_{act}) or spacing (S_{act}) at which the anchor is to be installed.
5. The load-adjustment factor (f_c or f_s) is the intersection of the row and column.
6. Multiply the allowable load by the applicable load-adjustment factor.
7. Reduction factors for multiple edges or spacing are multiplied together.
8. Adjustment factors do not apply to allowable steel strength values.
9. Adjustment factors are to be applied to allowable tension or shear load based on CMU strength values only.

End Distance Tension (f_c)

2. C_{act} = actual end or edge distance at which anchor is installed (inches).
3. C_{cr} = critical end or edge distance for 100% load (inches).
4. C_{min} = minimum end or edge distance for reduced load (inches).
5. f_c = adjustment factor for allowable load at actual end or edge distance.
6. f_{ccr} = adjustment factor for allowable load at critical end or edge distance. f_{ccr} is always = 1.00.
7. f_{cmin} = adjustment factor for allowable load at minimum end or edge distance.
8. $f_c = f_{cmin} + [(1 - f_{cmin}) (C_{act} - C_{min}) / (C_{cr} - C_{min})]$.

Spacing Shear (f_s)

S_{act} (in.)	Dia.	1/2	5/8	3/4
	E	4 1/4	5	6 3/4
	S_{cr}	17	20	27
	S_{min}	8	8	8
	f_{smin}	1.00	1.00	1.00
8		1.00 for all spacing \geq 8 in.		
12				
16				
17				
20				
24				
27				

1. E = Embedment depth (inches).
2. S_{act} = actual spacing distance at which anchors are installed (inches).
3. S_{cr} = critical spacing distance for 100% load (inches).
4. S_{min} = minimum spacing distance for reduced load (inches).
5. f_s = adjustment factor for allowable load at actual spacing distance.
6. $f_{s cr}$ = adjustment factor for allowable load at critical spacing distance. $f_{s cr}$ is always = 1.00.
7. $f_{s min}$ = adjustment factor for allowable load at minimum spacing distance.
8. $f_s = f_{s min} + [(1 - f_{s min}) (S_{act} - S_{min}) / (S_{cr} - S_{min})]$.

* See page 12 for an explanation of the load table icons.

EDOT Epoxy Adhesive

Formulated specifically for transportation projects, EDOT adhesive is a two-component, high-solids epoxy system. It is designed for use as a high-strength, non-shrink anchor-grouting material. EDOT adhesive provides an economical solution for transportation applications. Visit www.strongtie.com/DOT for specific state DOT approvals.

Features

- Meets ASTM C881 and AASHTO M-235 specifications for Type I, II, IV and V, Grade 3, Class C
- Cure times – 24 hours at 60°F, 72 hours at 40°F
- Easy hole-cleaning procedure – no power-brushing required
- Suitable for use in damp or wet anchor sites
- When properly mixed, adhesive will be a uniform tan color
- Available in 22 oz. and 56 oz. cartridges for application versatility
- Available in 1-, 10- and 100-gallon bulk kits
- Made in the USA using global materials

Applications

- Threaded rod anchoring and rebar doweling into concrete and masonry
- Multiple DOT listings – refer to www.strongtie.com/DOT for current approvals

Codes: Multiple DOT listings (refer to www.strongtie.com/DOT for current approvals)

Chemical Resistance

See pages 320–321.

Installation and Application Instructions

(See also pages 124–127.)

- Surfaces to receive epoxy must be clean.
- Base material temperature must be 40°F or above at the time of installation. For best results, material should be 70°–80°F at time of application.
- To warm cold material, store cartridges in a warm, uniformly heated area or storage container. Do not immerse cartridges in water to facilitate warming.
- Mixed material in nozzle can harden in 30 minutes at temperatures of 70°F and above.

Suggested Specifications

See www.strongtie.com for more information.

EDOT Adhesive

EDOT Epoxy Adhesive

Test Criteria

Anchors installed with EDOT adhesive have been tested in accordance with ASTM E1512.

Property	Test Method	Result*
Consistency (77°F)	ASTM C881	Non-sag/thixotropic paste
Heat deflection	ASTM D648	127°F (53°C)
Bond strength (moist cure, 60°F) Hardened concrete to hardened concrete	ASTM C882	2,920 psi (2 days) 3,410 psi (14 days)
Bond strength Fresh concrete to hardened concrete	ASTM C882	2,298 psi (14 days)
Water absorption	ASTM D570	0.11% (24 hours)
Compressive yield strength (cured 60°F)	ASTM D695	10,390 psi (7 days)
Compressive modulus (cured 60°F)	ASTM D695	408,100 psi (7 days)
Shore D Hardness	ASTM D2240	83
Gel time	ASTM C881	60 minutes
Shrinkage coefficient	ASTM D2566	0.002 in./in.
VOC	ASTM D2369	6 g/L

*Material and curing conditions: 73 ± 2°F, unless otherwise noted.

EDOT Package Systems

Model No.	Capacity	Cartridge Type	Carton Quantity	Dispensing Tool(s)	Mixing Nozzle
EDOT22	22 ounces	cartridge, side-by-side	10	EDT22S, EDTA22CKT, EDTA22P	EMN22i
EDOT22-N ¹	22 ounces	cartridge, side-by-side	10	EDT22S, EDTA22CKT, EDTA22P	EMN22i
EDOT56	56 ounces	cartridge, side-by-side	6	EMN22i or EMN50	—
EDOT1KT	1-gallon kit	(2) ½ gal. pails	1 kit	For bulk applications, use the EMN37A bulk mixing nozzle.	
EDOT10KT	10-gallon kit	(2) 5 gal. pails	1 kit		
EDOT100KT	100-gallon kit	(2) 50 gal. drums	1 kit		

1. Cartridge estimation guidelines are available at www.strongtie.com/apps.

2. Detailed information on dispensing tools, mixing nozzles and other adhesive accessories is available on pages 128 through 135, or at www.strongtie.com.

3. Use only Simpson Strong-Tie® mixing nozzles in accordance with Simpson Strong-Tie instructions. Modification or improper use of mixing nozzle may impair EDOT adhesive performance.

4. One EMN22i mixing nozzle and one nozzle extension are supplied with each cartridge.

Cure Schedule

Base Material Temperature		Cure Time
°F	°C	
40	4	72 hrs
60	16	24 hrs
80	27	24 hrs
100	38	24 hrs

In-Service Temperature Sensitivity

60	16	60
70	21	35
80	27	25
90	32	15
100	38	10

Adhesive Anchoring Installation Instructions

NOTE: Always check expiration date on product label. Do not use expired product.

WARNING: When drilling and cleaning hole, use eye and lung protection. When installing adhesive, use eye and skin protection.

1 Hole Preparation – Horizontal, Vertical and Overhead Applications

1. Drill.
Drill hole to specified diameter and depth.

2. Blow.
Remove dust from hole with oil-free compressed air for a minimum of 4 seconds. Compressed air nozzle must reach the bottom of the hole.

3. Brush.
Clean with a nylon brush for a minimum of 4 cycles. Brush should provide resistance to insertion. If no resistance is felt, the brush is worn and must be replaced.

4. Blow.
Remove dust from hole with oil-free compressed air for a minimum of 4 seconds. Compressed air nozzle must reach the bottom of the hole.

Refer to page 135 or visit www.strongtie.com for proper brush part number.

2 Cartridge Preparation

1. Check.

Check expiration date on product label. **Do not use expired product.** Product is usable until end of printed expiration month.

2. Open.

Open cartridge per package instructions.

3. Attach.

Attach proper Simpson Strong-Tie® nozzle and extension to cartridge. Do not modify nozzle.

4. Insert.

Insert cartridge into dispensing tool.

5. Dispense.

Dispense adhesive to the side until properly mixed (uniform color).

Refer to www.strongtie.com for proper mixing nozzle and dispensing tool part number.

FOR SOLID BASE MATERIALS

3A Filling the Hole – Vertical Anchorage

Prepare the hole per “Hole Preparation” instructions on product label.

DRY AND DAMP HOLES:

1. Fill.
Fill hole 1/2 to 3/4 full, starting from bottom of hole to prevent air pockets. Withdraw nozzle as hole fills up.

2. Insert.
Insert clean, oil-free anchor, turning slowly until the anchor contacts the bottom of the hole.

Threaded rod or rebar

3. Do not disturb.

Do not disturb anchor until fully cured. (See cure schedule for specific adhesive.)

WATER-FILLED HOLES:

1. Fill.
Fill hole completely full, starting from bottom of hole to prevent water pockets. Withdraw nozzle as hole fills up.

2. Insert.
Insert clean, oil-free anchor, turning slowly until the anchor contacts the bottom of the hole.

Threaded rod or rebar

3. Do not disturb.

Do not disturb anchor until fully cured. (See cure schedule.)

Note: Nozzle extensions may be needed for deep holes.

Adhesive Anchoring Installation Instructions

3B Filling the Hole – Piston Plug Delivery System

Prepare the hole per “Hole Preparation” instructions on product label

Step 1:

- Attach the piston plug to one end of the flexible tubing (PPFT25)
- Cut tubing to the length needed for the application, mark tubing as noted below and attach other end of tubing to the mixing nozzle
- If using a pneumatic dispensing tool, regulate air pressure to 80–100 psi

Step 2:

- Insert the piston plug to the back of the drilled hole and dispense adhesive

Step 3:

- Fill the hole 1/2 to 2/3 full
- **Note:** as adhesive is dispensed into the drilled hole, the piston plug will slowly displace out of the hole due to back pressure, preventing air gaps

Step 4:

- Install the appropriate Simpson Strong-Tie adhesive retaining cap

Step 5:

- Place either threaded rod or rebar through the adhesive retaining cap and into adhesive-filled hole
- Turn rod/rebar slowly until the insert bottoms out
- Do not disturb until fully cured

3C Filling the Hole – Horizontal and Overhead Anchorage with Adhesive Retaining Caps

Prepare the hole per “Hole Preparation” instructions on product label.

1. Install.

Install Simpson Strong-Tie® ARC adhesive retaining cap. Refer to page 132 or visit www.strongtie.com for proper ARC size.

Note: Nozzle extensions may be needed for deep holes.

2. Fill.

Fill hole 1/2–2/3 full, starting from bottom of hole to prevent air pockets. Withdraw nozzle as hole fills up.

Threaded rod or rebar

3. Insert.

Insert clean, oil-free anchor, turning slowly until the anchor contacts the bottom of the hole.

Threaded rod or rebar

4. Do not disturb.

Do not disturb anchor until fully cured (see cure schedule).

FOR HOLLOW BASE MATERIALS

3D Filling the Hole – When Anchoring with Screens: For AT, ET-HP®, SET-XP® and SET Adhesives (except SET1.7KTA)

Prepare the hole per instructions on “Hole Preparation.”

1. Fill.

Fill screen completely. Fill from the bottom of the screen and withdraw the nozzle as the screen fills to prevent air pockets. (Opti-Mesh screens: Close integral cap after filling.)

2. Insert.

Insert adhesive-filled screen into hole.

3. Insert.

Insert clean, oil-free anchor, turning slowly until the anchor contacts the bottom of the screen.

4. Do not disturb.

Do not disturb anchor until fully cured. (See cure schedule for specific adhesive.)

Installation instructions continued on page 126. →

Adhesive Anchoring Installation Instructions

FOR UNREINFORCED BRICK MASONRY

1A Hole Preparation – For Configurations A and C (Horizontal) and B (22½-Degree Downward) Installations with a Carbide-Tipped Drill Bit.

1. Drill.

Drill 1-inch-diameter hole to specified depth with a carbide-tipped drill bit, using rotation only mode. For Configurations A and C, drill 8 inches deep. For Configuration B, drill to within 1 inch of the opposite side of wall (minimum 13 inches deep).

2. Blow.

Remove dust from hole with oil-free compressed air for a minimum of 4 seconds. Compressed air nozzle MUST reach the bottom of the hole.

3. Brush.

Clean with a nylon brush for a minimum of 4 cycles. Brush MUST reach the bottom of the hole. Brush should provide resistance to insertion. If no resistance is felt, the brush is worn and must be replaced.

4. Blow.

Remove dust from hole with oil-free compressed air for a minimum of 4 seconds. Compressed air nozzle MUST reach the bottom of the hole.

1B Hole Preparation – For using SET Adhesive Configurations A and C (Horizontal) and B (22½-Degree Downward) Installations with a Wet Diamond Core-Drill Bit. (See page 114, footnote 4.)

1. Drill.

Drill hole to specified depth with 1-inch-diameter wet diamond core-drill bit. For Configurations A and C, drill 8 inches deep. For Configuration B, drill to within 1 inch of the opposite side of wall (minimum 13 inches deep).

2. Flush.

Flush out hole with pressurized water until water runs clear.

3. Brush.

Clean with a nylon brush (Simpson Strong-Tie part number ETB10) for a minimum of 4 brush strokes. Brush MUST reach the bottom of the hole. Brush should provide resistance to insertion. If no resistance is felt, the brush is worn and must be replaced.

4. Flush.

Flush out hole with pressurized water until water runs clear.

5. Blow.

Remove free standing water from hole with oil-free compressed air and blow out hole for a minimum of 30 seconds. Compressed air nozzle MUST reach the bottom of the hole.

6. Brush.

Clean with a nylon brush (Simpson Strong-Tie part number ETB10) for a minimum of 4 brush strokes. Brush MUST reach the bottom of the hole. Brush should provide resistance to insertion. If no resistance is felt, the brush is worn and must be replaced.

7. Blow.

Blow hole with oil-free compressed air for a minimum of 4 seconds. Compressed air nozzle MUST reach the bottom of the hole.

Adhesive Anchoring Installation Instructions

2 Cartridge Preparation

1. Check.

Check cartridge expiration date. **Do not use expired product.** Product is usable until end of printed expiration month.

2. Open.

Open cartridge per package instructions.

3. Attach.

Attach proper Simpson Strong-Tie® nozzle to cartridge. Do not modify nozzle.

4. Insert.

Insert cartridge into dispensing tool.

5. Dispense.

Dispense adhesive to the side until properly mixed (uniform color).

3A Filling the Hole – For Configurations A (Horizontal) and B (22½ - Degree Downward) Installations.

1. Fill.

Fill screen completely. Fill from the bottom of the screen and withdraw the nozzle as the screen fills to prevent air pockets. (Opti-Mesh® screens: Close integral cap after filling.)

2. Insert.

Insert adhesive filled screen into hole.

3. Insert.

Insert clean, oil-free anchor, turning slowly until the anchor contacts the bottom of the screen.

4. Do not disturb.

Do not disturb anchor until fully cured. (See cure schedule for specific adhesive.)

Note: Opti-Mesh® plastic screens or steel wire mesh screens may be used for Configurations A and B.

3B Filling the Hole – For Configuration C (Horizontal Through-Bolt) Installation.

1. Fill.

Fill screen completely. Fill from the bottom of the screen and withdraw the nozzle as the screen fills to prevent air pockets.

2. Insert.

Insert adhesive filled screen into hole.

3. Insert.

Insert steel sleeve (capped end first) slowly into screen tube (adhesive will displace).

4. Cure

Allow adhesive to cure (see Cure Time Table 1).

5. Drill.

Drill through plastic plug in (inside) end of steel sleeve and completely through the wall with 5/8" carbide tipped concrete drill bit (rotation mode only).

6. Insert.

Insert 5/8" rod through hole and attach metal plate and nut.

Note: Steel wire mesh screens shall be used for Configuration C.

Adhesive Accessories

Adhesive Dispensing Tools

CDT10S

Manual dispensing tool for 10 oz. single-cartridge adhesives

EDT22S

Manual dispensing tool for 22 oz. cartridges

EDTA22CKT

Battery-powered dispensing tool for 22 oz. cartridges
(kit includes two battery packs and charger)

EDTA22P

Pneumatic dispensing tool for 22 oz. cartridges

EDTA56P

Pneumatic dispensing tool for 56 oz. cartridges

ADT813S

Manual dispensing tool for 12.5 oz. cartridges

ADT30S

Manual dispensing tool for 30 oz. cartridges

ADTA30CKT

Battery-powered dispensing tool for 30 oz. cartridges
(kit includes two battery packs and charger)

ADTA30P

Pneumatic dispensing tool for 30 oz. cartridges

Adhesive Accessories

Adhesive Mixing Nozzles

EMN22i

An 18-element static mixing nozzle for use with 10 oz., 22 oz. and 56 oz. epoxy adhesive cartridges

EMN37A

An 18-element static mixing nozzle for dispensing epoxy adhesive through bulk metering equipment

EMN50

High-volume static mixing nozzle for 22 oz. and 56 oz. epoxy adhesive cartridges

AMN19Q

A 19-element, static mixing nozzle for use with 10 oz., 13 oz., and 30 oz. acrylic adhesive cartridges

For more information on adhesive dispensing tools and mixing nozzles, including ordering information, visit www.strongtie.com.

Adhesive Accessories

Piston Plug Delivery System

The Simpson Strong-Tie® Adhesive Piston Plug Delivery System offers you an easy-to-use, more reliable and less time-consuming means to dispense adhesive into drilled holes for threaded rod and rebar dowel installations at overhead, upwardly inclined and horizontal orientations.

The matched tolerance design between the piston plug and drilled hole virtually eliminates the formation of voids and air pockets during adhesive dispensing.

Features

- Designed for dispensing adhesive into drilled holes at overhead, upwardly inclined and horizontal orientations, as well as deep embedments
- Suitable for use with all Simpson Strong-Tie anchoring adhesives
- Adhesive piston plugs are sized to fit each drilled hole diameter
- Model number is embossed on each adhesive piston plug for identification
- A barbed end provides a reliable connection to the flexible extension tubing
- Flexible extension tubing is available in 25-foot-long rolls to be cut to required lengths

Adhesive Anchors

Use the piston plug delivery system with Simpson Strong-Tie® adhesive products:

Adhesive Anchors

Installation Sequence

Step 1:

- Attach the piston plug to one end of the flexible tubing (PPFT25)
- Cut tubing to the length needed for the application, mark tubing as noted below and attach other end of tubing to the mixing nozzle
- If using a pneumatic dispensing tool, regulate air pressure to 80–100 psi

Step 2:

- Insert the piston plug to the back of the drilled hole and dispense adhesive

Step 3:

- Fill the hole 1/2 to 3/4 full
- Note: as adhesive is dispensed into the drilled hole, the piston plug will slowly displace out of the hole due to back pressure, preventing air gaps

Step 4:

- Install the appropriate Simpson Strong-Tie adhesive retaining cap

Step 5:

- Place either threaded rod or rebar through the adhesive retaining cap and into adhesive-filled hole
- Turn rod/rebar slowly until the insert bottoms out
- Do not disturb until fully cured

Adhesive Accessories

Adhesive Retaining Caps

Adhesive retaining caps make overhead and horizontal installation easier by preventing the adhesive from running out of the hole. They also center the rod in the hole, making them ideal for applications where precise anchor placement is required. It may be necessary to provide support for the insert during cure time. Adhesive retaining caps are not designed to support the weight of the insert in overhead installations.

Material: Plastic

Adhesive Retaining Caps

The "X" cut in the cap allows the mixing nozzle and insert to pass through, while containing the adhesive in the hole.

Adhesive Accessories

Steel Adhesive-Anchoring Screen Tubes

Screen tubes are used in hollow base material applications to contain adhesive around the anchor and prevent it from running into voids. Simpson Strong-Tie® screen tubes are specifically designed to work with AT, SET and ET-HP® adhesives in order to precisely control the amount of adhesive that passes through the mesh. This results in thorough coating and bonding of the rod to the screen tube and base material. Order screen tubes based upon rod diameter and adhesive type. The actual outside diameter of the screen tube is larger than the rod diameter.

Material: Acrylic screen tubes: 50 mesh stainless steel
Epoxy screen tubes: 60 mesh carbon steel

Caution: Screen tubes are designed for a specific adhesive type. Epoxy screen tubes must be used with SET or ET-HP® formulations and acrylic screen tubes must be used with AT.

Epoxy Screen Tube
(Acrylic screen tubes similar)

Screen tubes are for use in hollow CMU, hollow brick and unreinforced masonry applications. Contact Simpson Strong-Tie for information on special-order sizes.

Note: Not for use with SET1.7KTA.

Adhesive Accessories

Opti-Mesh Adhesive-Anchoring Screen Tubes

Screen tubes are vital to the performance of adhesive anchors in base materials that are hollow or contain voids, such as hollow block and brick. The Simpson Strong-Tie® Opti-Mesh screen tube provides the economical advantage of a plastic screen tube while providing performance comparable to steel screen tubes and better than competitive plastic screen tubes.

Material: Plastic

⚠ Caution: Screen tubes are designed for a specific adhesive type. Epoxy screen tubes must be used with SET-XP®, ET-HP® or SET formulations, and acrylic adhesive screen tubes must be used with AT.

Adhesive Accessories

Hole-Cleaning Brushes

Brushes are used for cleaning drilled holes prior to adhesive anchor installation. Brushes have a twisted wire handle with nylon bristles.

Description	Model No.	For Anchor/Rebar Diameter (in.)	For Hole Diameter (in.)	Ctn Qty
½" dia x 3" brush (8" total length)	ETB4	¼" – ⅝"	⅜" – 7/16"	24
¾" x 4" brush (16" total length)	ETB6	⅜" – ⅝"	½" – ¾"	24
1" x 4" brush (16" total length)	ETB8	¾"	1⅜" – 7/8"	24
1" x 4" brush (24" total length)	ETB8L	¾"	1⅜" – 7/8"	24
1¼" x 4" brush (29" total length)	ETB10	7/8" – 1"	1" – 1½"	24
1⅝" x 6" brush (34" total length)	ETB12	1¼"	1⅜" – 1⅝"	24

ETB

Adhesive Shear Tubes

Used in conjunction with anchoring adhesive and screen tubes, adhesive shear tubes transfer anchor shear loads over a larger area, reducing localized crushing in unreinforced masonry installations. Required for through-bolt applications per ICC-ES's unreinforced masonry anchorage "Configuration C" detail. For detailed installation instructions, refer to the appropriate adhesive anchor ICC-ES report.

Adhesive Shear Tube

MATERIAL: Steel

FINISH: Zinc-plated

Description (in.)	Model No.	For use with Simpson Screen Model No. ¹	Drill Bit Dia. (in.)	Threaded Rod Diameter (in.)	Carton Qty.
1⅜" x 8	AST800	ETS758, ATS758	1	⅝"	1

1. Screens sold separately. Not for use with Simpson Strong-Tie screen ETS758P or ATS758P plastic Opti-Mesh screen tubes.

Configuration C

Retrofit Bolts

RFBs are pre-cut threaded rod, supplied with nut and washer. For use with Simpson Strong-Tie® adhesives. May be ordered in bulk without the nut and washer. Use with Simpson Strong-Tie adhesives to anchor into existing concrete and masonry. Each end of the threaded rod is stamped with rod length in inches and our "No-Equal" symbol for easy identification after installation.

MATERIAL: ASTM F1554 Grade 36

COATING: Zinc-plated, hot-dip galvanized

Description Dia. Length	Zinc-Plated Model No.	Hot-Dip Galvanized Model No.	Ctn Qty	Retail ² Pack
½" x 4"	RFB#4x4	RFB#4x4HDG	50	—

RFB Retrofit Bolts

1. Bulk quantities do not include the nut and washer and must be ordered with a "-B" suffix (example: RFB#4x5-B). Hot-dip galvanized RFBs not available in bulk.
2. Retail packs must be ordered with a "-R" suffix (example: RFB#5x12HDG-R).

Mechanical Anchors

From complex infrastructure projects to do-it-yourself ventures, Simpson Strong-Tie offers a wide variety of anchoring products to meet virtually any need.

Our mechanical anchors are designed to install easily and securely into a variety of base materials — from concrete and brick to hollow and grouted CMU. They offer optimal performance even in the most demanding structural applications. For applications where there is a risk of concrete cracking, specific anchors have been designed and tested to offer reliability under these conditions.

Torq-Cut™ Self-Undercutting Anchor

The Torq-Cut™ self-undercutting anchor is a heavy-duty, high-capacity anchor developed and tested for use in cracked and uncracked concrete under static and seismic conditions. The Torq-Cut features a built-in, hardened cutting ring that expands with installation torque, forming undercut grooves in the concrete. This interlock between the anchor and the concrete provides superior load-carrying capacity.

Features

- Code listed under IBC/IRC for cracked and uncracked concrete per ICC-ES ESR-2705
- Self-undercutting feature provides higher load-carrying capacity than conventional mechanical anchors
- Qualified for static and seismic loading conditions (seismic design categories A through F)
- Ductile steel rod provides consistent, reliable performance
- Specially designed, low-friction expansion cone minimizes binding and speeds installation
- Installation requires no special drill bit or secondary drilling operation
- Head is stamped with the Simpson Strong-Tie® “#” sign and anchor size identification for easy post-installation verification

Codes: ICC-ES ESR-2705 (concrete); City of L.A. RR25946 (concrete); Florida FL-15731.3

Material: Carbon steel

Coating: Zinc plated or sherardized*

Torq-Cut™ Setting Tool

The TCAST is the steel setting tool used to install the Torq-Cut self-undercutting anchor, driving the anchor into the pre-drilled hole and protecting the threads on the Torq-Cut anchor from being damaged by hammer blows.

**Torq-Cut™
Self-Undercutting Anchor**
U.S. Patent 7,357,613

**Torq-Cut™
Setting Tool**
(Sold separately)

Installation Instructions: Pre-Set Version

1. Drill a hole in the base material to the specified embedment depth using the appropriate diameter carbide drill bit specified for each diameter.
2. Blow the hole clean using compressed air.
3. Assemble the anchor with nut and washer, and finger-tighten the nut so all components are snug (spacer sleeve, expansion sleeve and cone). The bottom of the threaded rod should be flush with the bottom of the cone.
4. Place the anchor in the drilled hole, and use a hammer and setting tool to drive the anchor until the washer and nut are tight against the surface of the base material.
5. Remove the nut and washer and install the fixture. Reassemble the nut and washer over the fixture.
6. Tighten to the required installation torque.

Installation Instructions: Through-Set Version

1. Drill a hole in the base material to the specified embedment depth using the appropriate diameter carbide drill bit specified for each diameter.
2. Blow the hole clean using compressed air.
3. Assemble the anchor with nut and washer and finger-tighten the nut so all components are snug (spacer sleeve, expansion sleeve and cone). The bottom of the threaded rod should be flush with the bottom of the cone.
4. Place the anchor through the fixture and into the drilled hole. Use a hammer and setting tool to drive the anchor until the washer and nut are tight against the fixture.
5. Tighten to the required installation torque.

Caution: Oversized holes in the base material will make it difficult to set the anchor and will reduce the anchor's load capacity. Do not install in holes drilled with core drill bit.

- The Drilled Hole Depth is 1/2" greater than the Nominal Embedment Depth.
- For the Through-Set version of the Torq-Cut anchor, if the actual Fixture Thickness (t_{fx}) is less than the Maximum Fixture Thickness (F), the Minimum Drilled Hole Depth (A) must be increased as follows:

$$\text{Drilled Hole Depth} = A + (F - t_{fx})$$
 Similarly, the Minimum Nominal Embedment Depth (B) is increased as follows:

$$\text{Nominal Embedment Depth} = B + (F - t_{fx})$$

- The information presented in this table must be used in conjunction with the design criteria of ACI 318 Appendix D, except as modified below.
- The tabulated value of ϕ_{sa} applies when the load combinations of Section 1605.2.1 of the IBC, or ACI 318 Section 9.2 are used. If the load combinations of ACI 318 Appendix C are used, the appropriate value of ϕ_{sa} must be determined in accordance with ACI 318 D.4.4. Torq-Cut™ anchors are ductile steel elements as defined in ACI 318 D.1.
- N/A (Not Applicable) denotes that pullout resistance does not need to be considered.
- The tabulated value of ϕ_p applies when the load combinations of Section 1605.2.1 of the IBC, or ACI 318 Section 9.2 are used and the requirements of ACI 318 D.4.3(c) for Condition B are met. If the load combinations of ACI 318 Appendix C are used, appropriate value of ϕ must be determined in accordance with ACI 318 Section D.4.4(c).
- The tabulated value of ϕ_{cb} applies when both the load combinations of Section 1605.2.1 of the IBC, or ACI 318 Section 9.2 are used and the requirements of ACI 318 Section D.4.3(c) for Condition B are met. Condition B applies where supplementary reinforcement is not provided. For installations where supplementary reinforcement can be verified, the ϕ_{cb} factors described in ACI 318 D.4.3 for Condition A are allowed. If the load combinations of ACI 318 Section 9.2 are used and the requirements of ACI 318 Section D.4.3 for Condition A are met, the appropriate value of ϕ_{cb} must be determined in accordance with ACI 318 D.4.3(c). If the load combinations of ACI 318 Appendix C are used, the appropriate value of ϕ_{cb} must be determined in accordance with ACI 318 D.4.4(c).
- For sand-lightweight concrete, in lieu of ACI 318 Section D.3.6, modify the value of concrete breakout strength, $N_{p,cr}$, $N_{p,uncr}$ and N_{eq} by 0.6. All-lightweight concrete is beyond the scope of this table.
- Pullout strength applies for 2,500 psi $\leq f'_c \leq$ 3,500 psi concrete. For $f'_c >$ 3,500 psi concrete, pullout strength need not be considered since steel controls for concrete strengths greater than 3,500 psi.

* See page 12 for an explanation of the load table icons.

					Edge Distances = c_{ac} on all sides				Edge Distances = c_{min} on one side and c_{ac} on three sides			
					SDC A-B ⁵		SDC C-F ^{6,7}		SDC A-B ⁵		SDC C-F ^{6,7}	
					Uncracked	Cracked	Uncracked	Cracked	Uncracked	Cracked	Uncracked	Cracked
1/2	6%	8%	8%	7	10,645	9,410	8,065	7,060	9,190	8,040	6,895	6,030
5/8	8%	12	12	10	16,950	12,500	13,235	9,375	15,370	10,885	11,525	8,165
3/4	11%	15%	15%	7 3/4	25,090	22,395	19,195	16,800	16,385	14,335	12,290	10,755

1. Tension design strengths are based on the strength design provisions of ACI 318-11 Appendix D.
2. Tabulated values are for a single anchor with no influence of another anchor.
3. Interpolation between embedment depths is not permitted.
4. Strength reduction factor, ϕ , is based on using a load combination from ACI 318-11 Section 9.2.
5. The tension design strength listed for SDC (Seismic Design Category) A-B may also be used in SDC C-F when the tension component of the strength-level seismic design load on the anchor does not exceed 20% of the total factored tension load on the anchor associated with the same load combination.
6. When designing anchorages in SDC C-F, the designer shall consider the ductility requirements of ACI 318-11 Section D.3.3.
7. Tension design strengths in SDC C-F have been adjusted by 0.75 factor in accordance with ACI 318-11 Section D.3.3.4.4.

Torq-Cut™ Allowable Tension Loads in Normal-Weight Concrete ($f'_c = 2,500$ psi) — Static Load

Anchor Dia. (in.)	Nominal Embed. Depth (in.)	Min. Concrete Thickness h_{min} (in.)	Critical Edge Distance c_{ac} (in.)	Minimum Edge Distance c_{min} (in.)	Allowable Tension Load (lb.)			
					Edge Distances = c_{ac} on all sides		Edge Distances = c_{min} on one side and c_{ac} on three sides	
					Uncracked	Cracked	Uncracked	Cracked
1/2	6%	8%	8%	7	7,605	6,720	6,565	5,745
5/8	8%	12	12	10	12,105	8,930	10,980	7,775
3/4	11%	15%	15%	7 3/4	17,920	15,995	11,705	10,240

1. Allowable tension loads are calculated based on the strength design provision of ACI 318-11 Appendix D using a conversion factor of $\alpha = 1.4$. The conversion factor α is based on the load combination 1.2D + 1.6L assuming 50% dead load and 50% live load: $1.2(0.5) + 1.6(0.5) = 1.4$.
2. Tabulated values are for a single anchor with no influence of another anchor.
3. Interpolation between embedment depths is not permitted.

* See page 12 for an explanation of the load table icons.

Torq-Cut™ Design Information — Concrete

Torq-Cut™ Allowable Tension Loads in Normal-Weight Concrete
($f'_c = 2,500$ psi) — Wind Load

1. Allowable tension loads are calculated based on the strength design provision of ACI 318-11 Appendix D using a conversion factor of $\alpha = 1/0.7 = 1.43$. The conversion factor α is based on the load combination assuming 100% seismic load.
2. Tabulated values are for a single anchor with no influence of another anchor.
3. Interpolation between embedment depths is not permitted.
4. The allowable tension load listed for SDC (Seismic Design Category) A-B may also be used in SDC C-F when the tension component of the strength-level seismic design load on the anchor does not exceed 20% of the total factored tension load on the anchor associated with the same load combination.
5. When designing anchorages in SDC C-F, the designer shall consider the ductility requirements of ACI 318-11 Section D.3.3.
6. Tension design strengths in SDC C-F have been adjusted by 0.75 factor in accordance with ACI 318-11 Section D.3.3.4.4.

* See page 12 for an explanation of the load table icons.

Strong-Bolt® 2 Wedge Anchor

A wedge-type expansion anchor designed for optimal performance in cracked and uncracked concrete as well as uncracked masonry. The Strong-Bolt® 2 is available in carbon steel (¼" through 1" diameter), Type 304 (¼" diameter only) and Type 316 stainless steel (¼" through ¾" diameter).

Features

- Code listed under IBC/IRC for cracked and uncracked concrete per ICC-ES ESR-3037
- Code listed under IBC/IRC for masonry per IAPMO UES ER-240
- Qualified for static and seismic loading conditions (seismic design categories A through F)
- Suitable for horizontal, vertical and overhead applications
- Qualified for minimum concrete thickness of 3¼", and lightweight concrete-over-metal deck thickness of 2½" and 3¼"
- Standard (ANSI) fractional sizes: fits standard fixtures and installs with common drill bit and tool sizes

Codes: ICC-ES ESR-3037 (concrete); IAPMO UES ER-240 (carbon steel in CMU); City of L.A. RR25891 (concrete), RR25936 (carbon steel in CMU); Florida FL-15731.2; FL-16230.4; UL File Ex3605; FM 3043342 and 3047639; Multiple DOT listings; meets the requirements of Federal Specifications A-A-1923A, Type 4

Material: Carbon-steel stud with special alloy clip; stainless-steel stud with stainless-steel clip

Coating: Zinc plated

Strong-Bolt® 2 Wedge Anchor

Head Stamp

The head is stamped with the length identification letter, bracketed top and bottom by horizontal lines.

Material Specifications

Installation:

 Do not use an impact wrench to set or tighten the Strong-Bolt 2 anchor

 **Caution:** Oversized holes in the base material will make it difficult to set the anchor and will reduce the anchor's load capacity.

1. Drill a hole in the base material using a carbide drill bit the same diameter as the nominal diameter of the anchor to be installed. Drill the hole to the specified minimum hole depth, and blow it clean using compressed air. (Overhead installations need not be blown clean.) Alternatively, drill the hole deep enough to accommodate embedment depth and dust from drilling.
2. Assemble the anchor with nut and washer so the top of the nut is flush with the top of the anchor. Place the anchor in the fixture, and drive it into the hole until the washer and nut are tight against the fixture.
3. Tighten to the required installation torque.

Installation Sequence:

- The information presented in this table must be used in conjunction with the design criteria of ACI 318 Appendix D, except as modified below.
- The tabulated value of ϕ_{sa} applies when the load combinations of Section 1605.2.1 of the IBC or ACI 318 Section 9.2 are used. If the load combinations of ACI 318 Appendix C are used, the appropriate value of ϕ_{sa} must be determined in accordance with ACI 318 D.4.4. Strong-Bolt 2 anchors are ductile steel elements as defined in ACI 318 D.1.
- The tabulated value of ϕ_{cb} applies when both the load combinations of Section 1605.2.1 of the IBC or ACI 318 Section 9.2 are used and the requirements of ACI 318 D.4.3(c) for Condition B are met. Condition B applies where supplementary reinforcement is not provided. For installations where complying supplementary reinforcement can be verified, the ϕ_{cb} factors described in ACI 318 D.4.3 for Condition A are allowed. If the load combinations of ACI 318 Section 9.2 are used and the requirements of ACI 318 Section D.4.3 for Condition A are met, the appropriate value of ϕ_{cb} must be determined in accordance with ACI 318 D.4.3(c). If the load combinations of ACI 318 Appendix C are used, the appropriate value of ϕ_{cb} must be determined in accordance with ACI 318 D.4.4(c).
- N/A (not applicable) denotes that pullout resistance does not need to be considered.
- The characteristic pullout strength for greater concrete compressive strengths shall be increased by multiplying the tabular value by $(f'_c/2,500 \text{ psi})^{0.5}$.
- The tabulated value of ϕ_p or ϕ_{eq} applies when the load combinations of Section 1605.2.1 of the IBC or ACI 318 Section 9.2 are used and the requirements of ACI 318 D.4.3(c) for Condition B are met. If the load combinations of ACI 318 Appendix C are used, appropriate value of ϕ must be determined in accordance with ACI 318 Section D.4.4(c).
- The $\frac{1}{4}$ -inch diameter carbon steel Strong-Bolt 2 anchor installation in cracked concrete is beyond the scope of this report.
- The $\frac{1}{4}$ -inch diameter (6.4mm) anchor may be installed in top of uncracked normal-weight and sand-lightweight concrete over profile steel deck, where concrete thickness above upper flute meets the minimum thickness specified in the table on page 146.
- The $\frac{3}{8}$ -inch through 1-inch diameter (9.5mm through 25.4mm) anchors may be installed in top of cracked and uncracked normal-weight and sand-lightweight concrete over profile steel deck, where concrete thickness above upper flute meets the minimum thickness specified in the table on page 146.
- For sand-lightweight concrete, in lieu of ACI 318 Section D.3.6, modify the value of concrete breakout strength $N_{p,cr}$, $N_{p,uncr}$ and N_{eq} by 0.6. All-lightweight concrete is beyond the scope of this table.

* See page 12 for an explanation of the load table icons.

Strength Reduction Factor — Pullout Failure ⁸	ϕ_{eq}	—	0.65								

- The information presented in this table must be used in conjunction with the design criteria of ACI 318 Appendix D, except as modified below.
- The tabulated value of ϕ_{sa} applies when the load combinations of Section 1605.2.1 of the IBC or ACI 318 Section 9.2 are used, if the load combinations of ACI 318 Appendix C are used, the appropriate value of ϕ_{sa} must be determined in accordance with ACI 318 D.4.4. Strong-Bolt 2 anchors are ductile steel elements as defined in ACI 318 D.1.
- The tabulated value of ϕ_{cb} applies when both the load combinations of Section 1605.2.1 of the IBC or ACI 318 Section 9.2 are used and the requirements of ACI 318 D.4.3(c) for Condition B are met. Condition B applies where supplementary reinforcement is not provided. For installations where complying supplementary reinforcement can be verified, the ϕ_{cb} factors described in ACI 318 D.4.3 for Condition A are allowed. If the load combinations of ACI 318 Section 9.2 are used and the requirements of ACI 318 Section D.4.3 for Condition A are met, the appropriate value of ϕ_{cb} must be determined in accordance with ACI 318 D.4.3(c). If the load combinations of ACI 318 Appendix C are used, the appropriate value of ϕ_{cb} must be determined in accordance with ACI 318 D.4.4(c).
- N/A (not applicable) denotes that pullout resistance does not need to be considered.
- The characteristic pullout strength for greater concrete compressive strengths shall be increased by multiplying the tabular value by $(f'_c/2,500 \text{ psi})^{0.5}$.
- The characteristic pullout strength for greater concrete compressive strengths shall be increased by multiplying the tabular value by $(f'_c/2,500 \text{ psi})^{0.3}$.
- The characteristic pullout strength for greater concrete compressive strengths shall be increased by multiplying the tabular value by $(f'_c/2,500 \text{ psi})^{0.4}$.
- The tabulated value of ϕ_p or ϕ_{eq} applies when the load combinations of Section 1605.2.1 of the IBC or ACI 318 Section 9.2 are used and the requirements of ACI 318 D.4.3(c) for Condition B are met. If the load combinations of ACI 318 Appendix C are used, appropriate value of ϕ must be determined in accordance with ACI 318 Section D.4.4(c).
- The 1/4-inch diameter stainless steel Strong-Bolt 2 anchor installation in cracked concrete is beyond the scope of this report.
- The 1/4-inch diameter (6.4mm) anchor may be installed in top of uncracked normal-weight and sand-lightweight concrete over profile steel deck, where concrete thickness above upper flute meets the minimum thickness specified in the table on page 147.
- The 3/8-inch through 3/4-inch diameter (9.5mm through 19.1mm) anchors may be installed in top of cracked and uncracked normal-weight and sand-lightweight concrete over profile steel deck, where concrete thickness above upper flute meets the minimum thickness specified in the table on page 147.
- For sand-lightweight concrete, in lieu of ACI 318 Section D.3.6, modify the value of concrete breakout strength $N_{p,cr}$, $N_{p,uncr}$ and N_{eq} by 0.6. All-lightweight concrete is beyond the scope of this table.

* See page 12 for an explanation of the load table icons.

- The information presented in this table must be used in conjunction with the design criteria of ACI 318 Appendix D, except as modified below.
- The tabulated value of ϕ_{sa} applies when the load combinations of Section 1605.2.1 of the IBC or ACI 318 Section 9.2 are used and the requirements of ACI 318 D.4.3(c) Condition B are met. If the load combinations of ACI 318 Appendix C are used, the appropriate value of ϕ_{sa} must be determined in accordance with ACI 318 D.4.3.(c) for Strong-Bolt 2 anchors are ductile steel elements as defined in ACI 318 D.1.
- The tabulated value of ϕ_{cb} applies when both the load combinations of Section 1605.2.1 of the IBC or ACI 318 Section 9.2 are used and the requirements of ACI 318 D.4.3(c) for Condition B are met. Condition B applies where supplementary reinforcement is not provided. For installations where complying supplementary reinforcement can be verified, the ϕ_{cb} factors described in ACI 318 D.4.3 for Condition A are allowed. If the load combinations of ACI 318 Section 9.2 are used and the requirements of ACI 318 Section D.4.3 for Condition A are met, the appropriate value of ϕ_{cb} must be determined in accordance with ACI 318 D.4.3.(c). If the load combinations of ACI 318 Appendix C are used, the appropriate value of ϕ_{cb} must be determined in accordance with ACI 318 D.4.4.(c).
- The tabulated value of ϕ_{cp} applies when both the load combinations of ACI 318 Section 9.2 are used and the requirements of ACI 318 D.4.3(c) for Condition B are met. If the load combinations of ACI 318 Appendix C are used, appropriate value of ϕ_{cp} must be determined in accordance with ACI 318 Section D.4.4.(c).
- The $\frac{1}{4}$ -inch diameter stainless-steel Strong-Bolt 2 anchor installation in cracked concrete is beyond the scope of this report.
- The $\frac{1}{4}$ -inch diameter (6.4mm) anchor may be installed in top of uncracked normal-weight and sand-lightweight concrete over profile steel deck, where concrete thickness above upper flute meets the minimum thickness specified in the table on page 147.
- The $\frac{3}{8}$ -inch through $\frac{3}{4}$ -inch diameter (9.5mm through 19.1mm) anchors may be installed in top of cracked and uncracked normal-weight and sand-lightweight concrete over profile steel deck, where concrete thickness above upper flute meets the minimum thickness specified in the table on page 147.
- For sand-lightweight concrete, in lieu of ACI 318 Section D.3.6, modify the value of concrete breakout by 0.6. All-lightweight concrete is beyond the scope of this table.

* See page 12 for an explanation of the load table icons.

Strong-Bolt® 2 Design Information — Concrete

Carbon Steel Strong-Bolt® 2 Information for Installation in the Topside of Concrete-Filled Profile Steel Deck Floor and Roof Assemblies^{1,2,3,4}

Design Information	Symbol	Units	Nominal Anchor Diameter (in.)	
			3/8	1/2
Nominal Embedment Depth	h_{nom}	in.	1 7/8	2 3/4
Effective Embedment Depth	h_{ef}	in.	1 1/2	2 1/4
Minimum Concrete Thickness ⁵	$h_{min,deck}$	in.	2 1/2	3 1/4
Critical Edge Distance	$c_{ac,deck,top}$	in.	4 3/4	4
Minimum Edge Distance	$c_{min,deck,top}$	in.	4 3/4	4 1/2
Minimum Spacing	$s_{min,deck,top}$	in.	7	6 1/2

For SI: 1 inch = 25.4mm; 1 lbf = 4.45N

1. Installation must comply with the table on page 146 and Figure 1 below.
2. Design capacity shall be based on calculations according to values in the tables on pages 148 and 150.
3. Minimum flute depth (distance from top of flute to bottom of flute) is 1 1/2 inches.
4. Steel deck thickness shall be a minimum 20 gauge.
5. Minimum concrete thickness ($h_{min,deck}$) refers to concrete thickness above upper flute.

Stainless-Steel Strong-Bolt® 2 Information for Installation in the Topside of Concrete-Filled Profile Steel Deck Floor and Roof Assemblies^{1,2,3,4}

Design Information	Symbol	Units	Nominal Anchor Diameter (in.)	
			3/8	1/2
Nominal Embedment Depth	h_{nom}	in.	1 7/8	2 3/4
Effective Embedment Depth	h_{ef}	in.	1 1/2	2 1/4
Minimum Concrete Thickness ⁵	$h_{min,deck}$	in.	2 1/2	3 1/4
Critical Edge Distance	$c_{ac,deck,top}$	in.	4 3/4	4
Minimum Edge Distance	$c_{min,deck,top}$	in.	4 3/4	6
Minimum Spacing	$s_{min,deck,top}$	in.	6 1/2	8

For SI: 1 inch = 25.4mm; 1 lbf = 4.45N

1. Installation must comply with the table on page 147 and Figure 1 below.
2. Design capacity shall be based on calculations according to values in the tables on pages 149 and 151.
3. Minimum flute depth (distance from top of flute to bottom of flute) is 1 1/2 inches.
4. Steel deck thickness shall be a minimum 20 gauge.
5. Minimum concrete thickness ($h_{min,deck}$) refers to concrete thickness above upper flute.

Pullout Strength, concrete on metal deck (uncracked) ^{3,4}	$N_{p,deck,uncr}$	lb.	1,765 ⁷	3,150 ⁷	2,580 ⁷	3,840 ⁷	3,685 ⁷	6,565 ⁷	3,800 ⁷	2,275 ⁷	4,795 ⁷
Pullout Strength, concrete on metal deck (seismic) ^{3,4}	$N_{p,deck,eq}$	lb.	1,040 ⁷	2,615 ⁷	2,040 ⁷	2,730 ⁷	2,615 ⁷	4,990 ⁷	2,815 ⁷	1,340 ⁷	3,785 ⁷
Steel Strength in Shear, concrete on metal deck ⁵	$V_{sa,deck}$	lb.	1,595	3,490	2,135	4,580	2,640	7,000	4,535	3,545	5,920
Steel Strength in Shear, concrete on metal deck (seismic) ⁵	$V_{sa,deck,eq}$	lb.	1,595	3,490	1,920	4,120	2,375	6,300	3,690	3,545	5,330

- The information presented in this table must be used in conjunction with the design criteria of ACI 318 Appendix D, except as modified below.
- Profile steel deck must comply with the configuration in Figure 2 on the previous page, and have a minimum base-steel thickness of 0.035 inch [20 gauge]. Steel must comply with ASTM A 653/A 653M SS Grade 33 with minimum yield strength of 33,000 psi. Concrete compressive strength shall be 3,000 psi minimum.
- For anchors installed in the soffit of sand-lightweight or normal-weight concrete over metal deck floor and roof assemblies, calculation of the concrete breakout strength may be omitted.
- In accordance with ACI 318 Section D.5.3.2, the nominal pullout strength in cracked concrete for anchors installed in the soffit of sand-lightweight or normal-weight concrete over metal deck floor and roof assemblies $N_{p,deck,cr}$ shall be substituted for $N_{p,cr}$. Where analysis indicates no cracking at service loads, the normal pullout strength in uncracked concrete $N_{p,deck,uncr}$ shall be substituted for $N_{p,uncr}$. For seismic loads, $N_{p,deck,eq}$ shall be substituted for $N_{p,cr}$.
- In accordance with ACI 318 Section D.6.1.2(c), the shear strength for anchors installed in the soffit of sand-lightweight or normal-weight concrete over metal deck floor and roof assemblies $V_{sa,deck}$ shall be substituted for V_{sa} . For seismic loads, $V_{sa,deck,eq}$ shall be substituted for V_{sa} .
- The minimum anchor spacing along the flute must be the greater of $3.0h_{ef}$ or 1.5 times the flute width.
- The characteristic pull-out strength for greater concrete compressive strengths shall be increased by multiplying the tabular value by $(f'_c / 3,000 \text{ psi})^{0.5}$.
- Concrete shall be normal-weight or structural sand-lightweight concrete having a minimum specified compressive strength, f'_c , of 3,000 psi.
- Minimum distance to edge of panel is $2h_{ef}$.

- The information presented in this table must be used in conjunction with the design criteria of ACI 318 Appendix D, except as modified below.
- Profile steel deck must comply with the configuration in Figure 2 on the previous page, and have a minimum base-steel thickness of 0.035 inch [20 gauge]. Steel must comply with ASTM A 653/A 653M SS Grade 33 with minimum yield strength of 33,000 psi. Concrete compressive strength shall be 3,000 psi minimum.
- For anchors installed in the soffit of sand-lightweight or normal-weight concrete over metal deck floor and roof assemblies, calculation of the concrete breakout strength may be omitted.
- In accordance with ACI 318 Section D.5.3.2, the nominal pullout strength in cracked concrete for anchors installed in the soffit of sand-lightweight or normal-weight concrete over metal deck floor and roof assemblies $N_{p,deck,cr}$ shall be substituted for $N_{p,cr}$. Where analysis indicates no cracking at service loads, the normal pullout strength in uncracked concrete $N_{p,deck,uncr}$ shall be substituted for $N_{p,uncr}$. For seismic loads, $N_{p,deck,eq}$ shall be substituted for $N_{p,cr}$.
- In accordance with ACI 318 Section D.6.1.2(c), the shear strength for anchors installed in the soffit of sand-lightweight or normal-weight concrete over metal deck floor and roof assemblies $V_{sa,deck}$ shall be substituted for V_{sa} . For seismic loads, $V_{sa,deck,eq}$ shall be substituted for V_{sa} .
- The minimum anchor spacing along the flute must be the greater of $3.0h_{ef}$ or 1.5 times the flute width.
- The characteristic pull-out strength for greater concrete compressive strengths shall be increased by multiplying the tabular value by $(f'_c / 3,000 \text{ psi})^{0.5}$.
- The characteristic pull-out strength for greater concrete compressive strengths shall be increased by multiplying the tabular value by $(f'_c / 3,000 \text{ psi})^{0.3}$.
- The characteristic pull-out strength for greater concrete compressive strengths shall be increased by multiplying the tabular value by $(f'_c / 3,000 \text{ psi})^{0.4}$.
- Concrete shall be normal-weight or structural sand-lightweight concrete having a minimum specified compressive strength, f'_c , of 3,000 psi.
- Minimum distance to edge of panel is $2h_{ef}$.

* See page 12 for an explanation of the load table icons.

- Tension design strengths are based on the strength design provisions of ACI 318-11 Appendix D.
- Tabulated values are for a single anchor with no influence of another anchor.
- Interpolation between embedment depths is not permitted.
- Strength reduction factor, ϕ , is based on using a load combination from ACI 318-11 Section 9.2.
- The tension design strength listed for SDC (Seismic Design Category) A-B may also be used in SDC C-F when the tension component of the strength-level seismic design load on the anchor does not exceed 20% of the total factored tension load on the anchor associated with the same load combination.
- When designing anchorages in SDC C-F, the designer shall consider the ductility requirements of ACI 318-11 Section D.3.3.
- Tension design strengths in SDC C-F have been adjusted by 0.75 factor in accordance with ACI 318-11 Section D.3.3.4.4.

Carbon Steel Strong-Bolt® 2 Allowable Tension Loads

Strong-Bolt® 2 Design Information — Concrete

Carbon Steel Strong-Bolt® 2 Allowable Tension Loads in Soffit of Normal-Weight or Sand-Lightweight Concrete-Filled Profile Steel Deck Assemblies ($f'_c = 3,000$ psi) — Wind Load

Anchor Dia. (in.)	Nominal Embed. Depth (in.)	Minimum End Distance c_{min} (in.)	Allowable Tension Load (lb.)			
			Lower Flute		Upper Flute	
			Uncracked	Cracked	Uncracked	Cracked
3/8	2	3 1/4	685	405	890	520
	3 3/8	6	1,230	1,020	—	—
1/2	2 3/4	4 1/2	1,005	795	1,870	1,475
	4 1/2	8	1,495	1,065	—	—
5/8	3 3/8	5 1/2	1,435	1,020	—	—
	5 5/8	10	2,560	1,945	—	—
3/4	4 1/8	6 3/4	1,480	1,100	—	—

1. Allowable tension loads are calculated based on the strength design provision of ACI 318-11 Appendix D using a conversion factor of $\alpha = 1/1.67 = 0.6$. The conversion factor α is based on the load combination assuming 100% wind load.
2. Tabulated values are for a single anchor with no influence of another anchor.
3. Interpolation between embedment depths is not permitted.
4. Installation must comply with Figure 2 on page 152.

Carbon Steel Strong-Bolt® 2 Allowable Tension Loads in Soffit of Normal-Weight or Sand-Lightweight Concrete-Filled Profile Steel Deck Assemblies ($f'_c = 3,000$ psi) — Seismic Load

3/4	4 1/8	6 3/4	1,730	1,280	1,300	960	—	—	—	—

1. Allowable tension loads are calculated based on the strength design provision of ACI 318-11 Appendix D using a conversion factor of $\alpha = 1/1.43 = 0.7$. The conversion factor α is based on the load combination assuming 100% seismic load.
2. Tabulated values are for a single anchor with no influence of another anchor.
3. Interpolation between embedment depths is not permitted.
4. The allowable tension load listed for SDC (Seismic Design Category) A-B may also be used in SDC C-F when the tension component of the strength-level seismic design load on the anchor does not exceed 20% of the total factored tension load on the anchor associated with the same load combination.
5. When designing anchorages in SDC C-F, the designer shall consider the ductility requirements of ACI 318-11 Section D.3.3.
6. Tension design strengths in SDC C-F have been adjusted by 0.75 factor in accordance with ACI 318-11 Section D.3.3.4.4.
7. Installation must comply with Figure 2 on page 152.

* See page 12 for an explanation of the load table icons.

- The tabulated allowable loads are based on a safety factor of 5.0 for installation under the IBC and IRC.
- Listed loads may be applied to installations on the face of the CMU wall at least 1 1/4 inch away from headjoints.
- Values for 8-inch-wide concrete masonry units (CMU) with a minimum specified compressive strength of masonry, f'_m , at 28 days is 1,500 psi.
- Embedment depth is measured from the outside face of the concrete masonry unit.
- Tension and shear loads may be combined using the parabolic interaction equation ($n = 5/8$).
- Refer to allowable load adjustment factors for edge distance and spacing on page 163.
- Allowable loads may be increased 33 1/3% for short-term loading due to wind forces or seismic forces where permitted by code.

Strong-Bolt® 2 Design Information — Masonry

Carbon-Steel Strong-Bolt® 2 Allowable Load Adjustment Factors for Face-of-Wall Installation in 8" Grout-Filled CMU: Edge Distance and Spacing, Tension and Shear Loads

How to use these charts:

1. The following tables are for reduced edge distance and spacing.
2. Locate the anchor size to be used for either a tension and/or shear load application.
3. Locate the embedment (E) at which the anchor is to be installed.
4. Locate the edge distance (c_{act}) or spacing (s_{act}) at which the anchor is to be installed.
5. The load adjustment factor (f_c or f_s) is the intersection of the row and column.
6. Multiply the allowable load by the applicable load adjustment factor.
7. Reduction factors for multiple edges or spacings are multiplied together.

Edge or End Distance Tension (f_c)

c_{act} (in.)	Dia.	¼	⅜	½	⅝	¾	IBC*
	E	1¼	2⅝	3½	4⅞	5¼	
	c_{cr}	12	12	12	20	20	
	c_{min}	2	4	4	4	4	
	f_{cmin}	1.00	1.00	1.00	1.00	0.97

* See page 12 for an explanation of the load table icons.

Wedge-All® Wedge Anchor

A non-bottom-bearing, wedge-style expansion anchor for use in solid concrete or grout-filled masonry. The Wedge-All® wedge anchor is available in carbon steel with zinc or mechanically galvanized coating, as well as Types 303/304 and Type 316 stainless steel. Threaded studs are set by tightening the nut to the specified torque. The Wedge-All is code listed for grout-filled masonry applications.

Features

- Code-listed under IBC/IRC for grout-filled CMU per ICC-ES ESR-1396
- One-piece, wrap-around clip ensures uniform holding capacity
- Threaded end is chamfered for ease of starting nut
- Available in a wide range of diameters and lengths

Codes: ICC-ES ESR-1396 (CMU); Florida FL-15730.7; FM 3017082 and 3131136; UL File Ex3605; Multiple DOT listings; meets the requirements of Federal Specification A-A-1923A, Type 4

Material: Carbon or stainless steel (Types 303/304; Type 316)

Coating: Carbon steel anchors are available zinc plated or mechanically galvanized

Installation

- Do not use an impact wrench to set or tighten anchors.
 - Caution:** Oversized holes in the base material will make it difficult to set the anchor and will reduce the anchor's load capacity.
1. Drill a hole in base material using a carbide drill bit the same diameter as the nominal diameter of the anchor to be installed. Drill the hole to the specified embedment depth, and blow it clean using compressed air. (Overhead installations need not be blown clean.) Alternatively, drill the hole deep enough to accommodate the embedment depth and the dust from drilling.
 2. Assemble the anchor with nut and washer so the top of the nut is flush with the top of the anchor. Place the anchor in the fixture, and drive it into the hole until the washer and nut are tight against the fixture.
 3. Tighten to the required installation torque.

Head Stamp
The head is stamped with the length identification letter.

Wedge-All® Anchor

1. The published length is the overall length of the anchor. Allow one anchor diameter for the nut and washer thickness plus the fixture thickness when selecting the minimum length.

Material Specifications

Carbon Steel — Zinc Plated			
Component Materials			
Anchor Body	Nut	Washer	Clip
Material Meets minimum 70,000 psi tensile strength	Carbon Steel ASTM A 563, Grade A	Carbon Steel	Carbon Steel

Application:
Interior environment, low level of corrosion resistance. See page 316 for more corrosion information.

Material Specifications

Carbon Steel - Mechanically Galvanized ¹			
Component Materials			
Anchor Body	Nut	Washer	Clip
Material Meets minimum 70,000 psi tensile strength	Carbon Steel ASTM A 563, Grade A	Carbon Steel	Carbon Steel

1. Mechanical Galvanizing meets ASTM B695, Class 55, Type 1.

Application:
Exterior unpolluted environment, medium level of corrosion resistance. Well suited to humid environments. See page 316 for more corrosion information.

1. The published length is the overall length of the anchor. Allow one anchor diameter for the nut and washer thickness plus the fixture thickness when selecting a length.
2. Anchors with the "SS" suffix in the model number are manufactured from Type-303 stainless steel; the remaining anchors (with the "4SS" suffix) are manufactured from Type 304 stainless steel. Types 303 and 304 stainless steel perform equally well in certain corrosive environments.

Material Specifications

Type 303/304 Stainless Steel ¹			
Component Materials			
Anchor Body	Nut	Washer	Clip
Type 303 or 304 Stainless Steel	Type 18-8 Stainless Steel	Type 18-8 Stainless Steel	Type 304 or 316 Stainless Steel

1. Types 303 and 304 stainless steels perform equally well in certain corrosive environments. Larger sizes are manufactured from Type 303.

Application:

Exterior environment, high level of corrosion resistance. Resistant to organic chemicals, many inorganic chemicals, mild atmospheric pollution and mild marine environments (not in direct contact with salt water). See page 316 for more corrosion information.

Material Specifications

Type 316 Stainless Steel ¹			
Component Materials			
Anchor Body	Nut	Washer	Clip
Type 316 Stainless Steel	Type 316 Stainless Steel	Type 316 Stainless Steel	Type 316 Stainless Steel

1. Type-316 stainless steel provides the greatest degree of corrosion resistance offered by Simpson Strong-Tie.

Application:

Exterior environment, high level of corrosion resistance. Resistant to chlorides, sulfuric acid compounds and direct contact with salt water. See page 316 for more corrosion information.

1. The allowable loads listed are based on a safety factor of 4.0.
2. Refer to allowable load-adjustment factors for edge distance and spacing on pages 172 and 174.
3. Drill bit diameter used in base material corresponds to nominal anchor diameter.
4. Allowable loads may be linearly interpolated between concrete strengths listed.
5. The minimum concrete thickness is 1½ times the embedment depth.

- The allowable loads listed are based on a safety factor of 4.0.
- Refer to allowable load-adjustment factors for edge distance on page 176.
- 100% of the allowable load is permitted at critical spacing. Loads at reduced spacing have not been determined.
- Drill bit diameter used in base material corresponds to nominal anchor diameter.
- The minimum concrete thickness is 1 1/2 times the embedment depth.
- Metal deck must be minimum 20 gauge.
- Wedge-All anchors installed in the bottom flute of the steel deck must have a minimum allowable edge distance of 1 1/2" from the inclined edge of the bottom flute.

Lightweight Concrete on Metal Deck

Carbon-Steel Wedge-All® Allowable Tension and Shear Loads in Grout-Filled CMU

Size in. (mm)	Embed. Depth in. (mm)	Critical Edge Dist. in. (mm)	Critical End Dist. in. (mm)	Critical Spacing in. (mm)	8" Grout-Filled CMU Allowable Load Based on CMU Strength						Install. Torque ft.-lb. (N-m)

3/4 (19.1)	5 1/4 (133)	21 (533)	21 (533)	21 (533)	4,320 (19.2)	248 (1.1)	865 (3.8)	10,160 (45.2)	801 (3.6)	2,030 (9.0)	120 (162.6)

- The tabulated allowable loads are based on a safety factor of 5.0 for installations under the IBC and IRC.
- Listed loads may be applied to installations on the face of the CMU wall at least 1 1/4 inch away from headjoints.
- Values for 8-inch wide concrete masonry units (CMU) with a minimum specified compressive strength of masonry, f'_m , at 28 days is 1,500 psi.
- Embedment depth is measured from the outside face of the concrete masonry unit.
- Drill bit diameter used in base material corresponds to nominal anchor diameter.
- Allowable loads may be increased 33 1/3% for short-term loading due to wind and seismic forces, where permitted by code.
- Tension and shear loads for the Wedge-All® anchor may be combined using the parabolic interaction equation ($n=3$).
- Refer to allowable load-adjustment factors for edge distance on page 176.

Shaded area = Placement for Full and Reduced Allowable Load Capacity in Grout-Filled CMU

Mechanical Anchors

Wedge-All® Design Information — Concrete

Allowable Load-Adjustment Factors for Carbon-Steel and Stainless-Steel Wedge-All® Anchors in Normal-Weight Concrete: Edge Distance, Tension and Shear Loads

How to use these charts:

1. The following tables are for reduced edge distance.
2. Locate the anchor size to be used for either a tension and/or shear load application.
3. Locate the edge distance (C_{act}) at which the anchor is to be installed.
4. The load adjustment factor (f_c) is the intersection of the row and column.
5. Multiply the allowable load by the applicable load adjustment factor.
6. Reduction factors for multiple edges are multiplied together.

Edge Distance Tension (f_c)

1. C_{act} = actual edge distance at which anchor is installed (inches).
2. C_{cr} = critical edge distance for 100% load (inches).
3. C_{min} = minimum edge distance for reduced load (inches).
4. f_c = adjustment factor for allowable load at actual edge distance.
5. $f_{c_{cr}}$ = adjustment factor for allowable load at critical edge distance. $f_{c_{cr}}$ is always = 1.00.
6. $f_{c_{min}}$ = adjustment factor for allowable load at minimum edge distance.
7. $f_c = f_{c_{min}} + [(1 - f_{c_{min}}) (C_{act} - C_{min}) / (C_{cr} - C_{min})]$.

Load-Adjustment Factors for Reduced Spacing:

Critical spacing is listed in the load tables. No adjustment in load is required when the anchors are spaced at critical spacing. No additional testing has been performed to determine the adjustment factors for spacing dimensions less than those listed in the load tables.

* See page 12 for an explanation of the load table icons.

Wedge-All® Design Information — Concrete

Allowable Load-Adjustment Factors for Carbon-Steel and Stainless-Steel Wedge-All® Anchors in Normal-Weight Concrete: Edge Distance and Shear Load Applied Parallel to Edge

How to use these charts:

1. The following tables are for reduced edge distance.
2. Locate the anchor size to be used for a shear load application.
3. Locate the edge distance ($c_{act||}$) at which the anchor is to be installed.
4. The load adjustment factor ($\phi_{c||}$) is the intersection of the row and column.
5. Multiply the allowable load by the applicable load adjustment factor.
6. Reduction factors for multiple edges are multiplied together.

Edge Distance Shear ($f_{c||}$) (Shear Applied Parallel to Edge with End Distance $\geq ED_{min}$)

Edge Dist. $c_{act }$ (in.)	Size	1/4	3/8	1/2	5/8	3/4	7/8	1	1 1/4

11									0.92
12									0.97
13									1.00

1. Table is not applicable to anchors with $ED < ED_{min}$. Factors from this table may not be combined with load-adjustment factors for shear loads applied perpendicular to edge.
2. $c_{act||}$ = actual edge distance (measured perpendicular to direction of shear load) at which anchor is installed (inches).
3. $c_{crit||}$ = critical edge distance (measured perpendicular to direction of shear load) for 100% load (inches).
4. $c_{min||}$ = minimum edge distance (measured perpendicular to direction of shear load) for reduced load (inches).
5. ED = actual end distance (measured parallel to direction of shear load) at which anchor is installed (inches).
6. ED_{min} = minimum edge distance (measured parallel to direction of shear load).
7. $f_{c||}$ = adjustment factor for allowable load at actual edge distance.
8. $f_{crit||}$ = adjustment factor for allowable load at critical edge distance. $f_{crit||}$ is always = 1.00.
9. $f_{cmin||}$ = adjustment factor for allowable load at minimum edge distance.
10. $f_{c||} = f_{cmin||} + [(1 - f_{cmin||}) (c_{act||} - c_{min||}) / (c_{crit||} - c_{min||})]$.

Wedge-All® Design Information — Concrete

Allowable Load-Adjustment Factors for Carbon-Steel and Stainless-Steel Wedge-All® Anchors in Normal-Weight Concrete: Spacing, Tension Loads

How to use these charts:

1. The following tables are for reduced spacing.
2. Locate the anchor size to be used for a tension load application.
3. Locate the anchor embedment (E) used for a tension load application.
4. Locate the spacing (s_{act}) at which the anchor is to be installed.
5. The load adjustment factor (f_s) is the intersection of the row and column.
6. Multiply the allowable load by the applicable load adjustment factor.
7. Reduction factors for multiple spacings are multiplied together.

Wedge-All® Design Information — Concrete

Allowable Load-Adjustment Factors for Carbon-Steel Wedge-All® Anchors in Sand-Lightweight Concrete: Edge Distance, Tension and Shear Loads

How to use these charts:

1. The following tables are for reduced edge distance.
2. Locate the anchor size to be used for either a tension and/or shear load application.
3. Locate the edge distance (c_{act}) at which the anchor is to be installed.
4. The load adjustment factor (f_c) is the intersection of the row and column.
5. Multiply the allowable load by the applicable load adjustment factor.
6. Reduction factors for multiple edges are multiplied together.

Edge Distance Tension (f_c)

17 1/2				1.00	0.86
21					1.00

1. c_{act} = actual edge distance at which anchor is installed (inches).
2. c_{cr} = critical edge distance for 100% load (inches).
3. c_{min} = minimum edge distance for reduced load (inches).
4. f_c = adjustment factor for allowable load at actual edge distance.
5. $f_{c_{cr}}$ = adjustment factor for allowable load at critical edge distance. $f_{c_{cr}}$ is always = 1.00.
6. $f_{c_{min}}$ = adjustment factor for allowable load at minimum edge distance.
7. $f_c = f_{c_{min}} + [(1 - f_{c_{min}})(c_{act} - c_{min}) / (c_{cr} - c_{min})]$

Load-Adjustment Factors for Reduced Spacing:

Critical spacing is listed in the load tables. No adjustment in load is required when the anchors are spaced at critical spacing. No additional testing has been performed to determine the adjustment factors for spacing dimensions less than those listed in the load tables.

* See page 12 for an explanation of the load table icons.

Tie-Wire Wedge Anchor

The Tie-Wire anchor is a wedge-style expansion anchor for use in normal-weight concrete or in concrete over metal deck. With a tri-segmented, dual-embossed clip, the Tie-Wire anchor is ideal for the installation of acoustic ceiling grid and is easily set with the claw of a hammer.

Features

- ¼" eyelet for easy threading of wire
- Sets with claw of hammer
- Tri-segmented clip – each segment adjusts independently to hole irregularities
- Dual embossments on each clip segment enable the clip to undercut into the concrete, increasing follow-up expansion
- Wedge-style expansion anchor for use in normal weight concrete or concrete over metal deck

Material: Carbon steel

Coating: Zinc plated

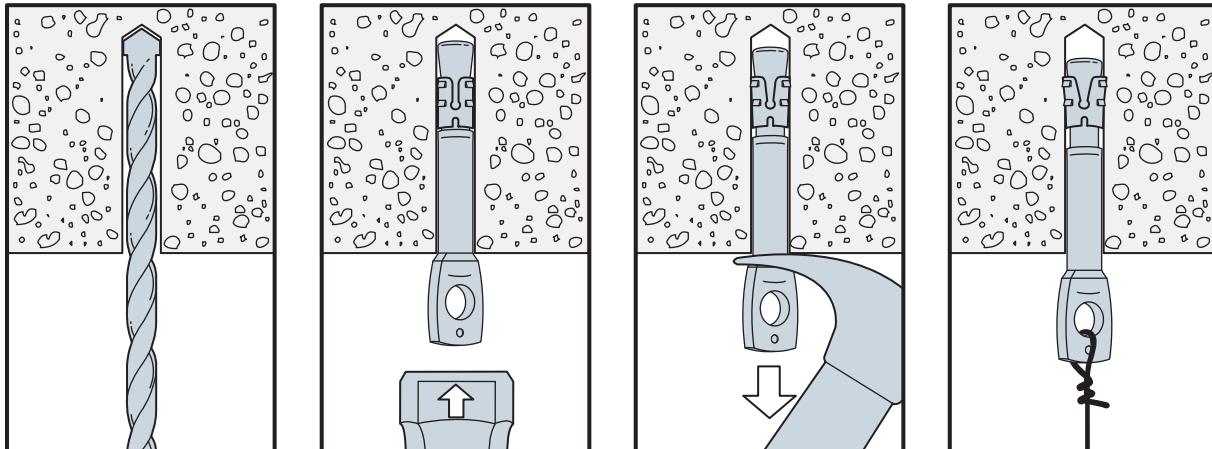

Installation

1. Drill a hole at least 1 ½" deep using a ¼" diameter carbide tipped bit.
2. Drive the anchor into the hole until the bottom of the head is flush with the base material.
3. Set the anchor by prying/pulling the head with the claw end of the hammer.

Size (in.)	Model No.	Drill Bit Dia. (in.)	Eyelet Hole Size (in.)	Quantity	
				Box	Carton
¼" x 1 ½"	TW25112	¼	¼	100	500

Installation Sequence

Tie-Wire Design Information — Concrete

Allowable Tension and Shear Loads for Tie-Wire Anchor in Normal-Weight Concrete

Size in. (mm)	Drill Bit Dia. in.	Embed Depth in. (mm)	Critical End Dist. in. (mm)	Critical Spacing in. (mm)	Tension Load		Shear Load	
					$f'_c \geq 2,500$ psi (17.2 MPa)		$f'_c \geq 2,500$ psi (17.2 MPa)	
					Ultimate lb. (kN)	Allowable lb. (kN)	Ultimate lb. (kN)	Allowable lb. (kN)
1/4 (6.4)	1/4	1 1/2 (38)	2 1/2 (64)	5 (127)	1,155 (5.1)	290 (1.3)	380 (1.7)	95 (0.4)

1. The allowable loads listed are based on a safety factor of 4.0.
2. The minimum concrete thickness is 1 1/2 times the embedment depth.

Allowable Tension and Shear Loads for Tie-Wire Anchor in the Soffit of Normal-Weight Concrete or Sand-Lightweight Concrete over Metal Deck

Size in. (mm)	Drill Bit Dia. in.	Embed Depth in. (mm)	Critical End Dist. ⁵ in. (mm)	Critical Spacing in. (mm)	Tension Load		Shear Load	
					$f'_c \geq 3,000$ psi (20.7 MPa)		$f'_c \geq 3,000$ psi (20.7 MPa)	
					Ultimate lb. (kN)	Allowable lb. (kN)	Ultimate lb. (kN)	Allowable lb. (kN)
1/4 (6.4)	1/4	1 1/2 (38)	2 1/2 (64)	5 (127)	1,155 (5.1)	290 (1.3)	460 (2.0)	115 (0.5)

1. The allowable loads listed are based on a safety factor of 4.0.
2. The minimum concrete thickness is 1 1/2 times the embedment depth.
3. Metal deck must be minimum 20-gauge thick with minimum yield strength of 33 ksi.
4. Anchors installed in the bottom flute of the steel deck must have a minimum edge distance of 1 1/2" away from inclined edge of the bottom flute. See the figure below.
5. Critical end distance is defined as the distance from the end of the slab in the direction of the flute.

Installation in the Soffit of Concrete over Metal Deck

* See page 12 for an explanation of the load table icons.

Easy-Set Pin-Drive Expansion Anchor

The Easy-Set is a pin-drive expansion anchor for medium- and heavy-duty fastening applications into concrete and grout-filled block. Integrated nut and washer help keep track of parts.

Material: Carbon steel

Coating: Yellow zinc dichromate plated

Installation

Caution: Oversized holes in the base material will make it difficult to set the anchor and will reduce the anchor's load capacity.

1. Drill a hole in the base material using a carbide drill bit the same diameter as the nominal diameter of the anchor to be installed. Drill the hole to the specified embedment depth plus ¼" to allow for pin extension and blow it clean using compressed air. (Overhead installations need not be blown clean.) Alternatively, drill the hole deep enough to accommodate embedment depth and the dust from drilling.
2. Adjust the nut for required embedment. Place the anchor through the fixture and into the hole.
3. Hammer the center pin until the bottom of the head is flush with top of anchor.

Installation Sequence

**Easy-Set
(EZAC)**

Mechanical Anchors

EZAC Product Data

Size (in.)	Model No.	Thread Length (in.)	Quantity

Min. Fixture Hole Size (in.)	7/16	9/16	11/16
Wrench Size (in.)	9/16	¾	15/16

EZAC Allowable Tension and Shear Loads in Normal-Weight Concrete

Size in.	Embed. Depth in. (mm)	Drill Bit Dia. in.	Critical Edge Dist. in. (mm)	Critical Spacing Dist. in. (mm)	Tension Load	Shear Load
					$f'_c \geq 2,000$ psi (13.8 MPa) Concrete	
					Allowable lb. (kN)	
¾	1¾ (44)	¾	2¾ (70)	5¼ (133)	630 (2.8)	645 (2.9)
½	2½ (64)	½	3¾ (86)	6¾ (171)	1,005 (4.5)	1,230 (5.5)
⅝	3 (76)	⅝	4¾ (108)	9 (229)	1,515 (6.7)	1,325 (5.9)

1. The allowable loads listed are based on a safety factor of 4.0.
2. 100% of the allowable load is permitted at critical spacing and critical edge distance. Allowable loads at lesser spacings and edge distance have not been determined.
3. The minimum concrete thickness is 1 ½ times the embedment depth.
4. Tension and shear loads for the EZAC anchor may be combined using the straight-line interaction equation ($n = 1$).

* See page 12 for an explanation of the load table icons.

Sleeve-All® Sleeve Anchor

Sleeve-All® expanding anchors are pre-assembled, expanding sleeve anchors for use in all types of solid base materials. This anchor is available in acorn, hex, rod coupler, flat or round head style for a wide range of applications.

Codes: Factory Mutual 3017082, 3026805 and 3029959 (3/8" – 1/2" diameter); Underwriters Laboratories File Ex3605 (3/8" – 3/4" diameter); Multiple DOT listings; meets the requirements of Federal Specification A-A-1922A

Material: Carbon steel or stainless steel

Coating: Carbon steel anchors are zinc plated

Installation

1. Drill a hole in the base material using a carbide drill bit the same diameter as the nominal diameter of the anchor to be installed.
2. Drill the hole to the specified embedment depth, and blow it clean using compressed air. (Overhead installations need not be blown clean.) Alternatively, drill the hole deep enough to accommodate embedment depth and the dust from drilling.
3. Place the anchor in the fixture, and drive it into the hole until the washer and nut are tight against the fixture.
4. Tighten to required installation torque.

Caution: Oversized holes will make it difficult to set the anchor and will reduce the anchor's load capacity.

1. The tabulated allowable loads are based on a safety factor of 4.0.
2. Allowable loads may not be increased for short-term loading due to wind or seismic forces.
3. Refer to allowable load-adjustment factors for spacing and edge distance on page 183.
4. Drill bit diameter used in base material corresponds to nominal anchor diameter.
5. Allowable tension loads may be linearly interpolated between concrete strengths listed.
6. The minimum concrete thickness is 1 ½ times the embedment depth.

1. The tabulated allowable loads are based on a safety factor of 5.0.
2. Listed loads may be applied to installations through a face shell with the following placement guidelines:
 - a. Minimum 3" from vertical mortar joint.
 - b. Minimum 1" from vertical cell centerline.
3. Values for 6- and 8-inch-wide concrete masonry units (CMU) with a minimum specified compressive strength of masonry, f'_m , at 28 days is 1,500 psi.
4. Embedment depth is measured from the outside face of the concrete masonry unit.
5. Drill bit diameter used in base material corresponds to nominal anchor diameter.

Face Shell Installation
Allowable Anchor Placement in grout-filled CMU shown by shaded areas.

* See page 12 for an explanation of the load table icons.

Sleeve-All® Design Information — Concrete

Allowable Load-Adjustment Factors for Sleeve-All® Anchors in Normal-Weight Concrete:
Edge Distance and Spacing, Tension and Shear Loads

How to use these charts:

1. The following tables are for reduced edge distance and spacing.
2. Locate the anchor size to be used for either a tension and/or shear load application.
3. Locate the edge distance (c_{act}) or spacing (s_{act}) at which the anchor is to be installed.
4. The load adjustment factor (f_c or f_s) is the intersection of the row and column.
5. Multiply the allowable load by the applicable load adjustment factor.
6. Reduction factors for multiple edges or spacing are multiplied together.

Edge Distance Tension (f_c)

Edge Dist. Cact (in.)	Size	1/4	5/16	3/8	1/2	5/8	3/4

1. E = Embedment depth (inches).
2. s_{act} = actual spacing distance at which anchors are installed (inches).
3. s_{cr} = critical spacing distance for 100% load (inches).
4. s_{min} = minimum spacing distance for reduced load (inches).
5. f_s = adjustment factor for allowable load at actual spacing distance.
6. f_{scr} = adjustment factor for allowable load at critical spacing distance.
 f_{scr} is always = 1.00.
7. f_{smin} = adjustment factor for allowable load at minimum spacing distance.
8. $f_s = f_{smin} + [(1 - f_{smin}) (s_{act} - s_{min}) / (s_{cr} - s_{min})]$.

Titen HD® Heavy-Duty Screw Anchor

The original high-strength screw anchor for use in cracked and uncracked concrete, as well as uncracked masonry. The Titen HD® offers low installation torque and outstanding performance. Designed and tested in dry, interior, non-corrosive environments or temporary outdoor applications, the Titen HD® demonstrates industry-leading performance even in seismic conditions.

Features

- Code listed under IBC/IRC in accordance with ICC-ES AC193 for cracked and uncracked concrete per ICC-ES ESR-2713
- Code listed under IBC/IRC in accordance with ICC-ES AC106 for masonry per ICC-ES ESR-1056
- Qualified for static and seismic loading conditions
- Thread design undercuts to efficiently transfer the load to the base material
- Standard fractional sizes
- Specialized heat-treating process creates tip hardness for better cutting without compromising the ductility
- No special drill bit required — designed to install using standard-sized ANSI tolerance drill bits
- Testing shows the Titen HD® installs in concrete with 50% less torque than competitor anchors
- Hex-washer head requires no separate washer and provides a clean installed appearance
- Removable — ideal for temporary anchoring (e.g., formwork, bracing) or applications where fixtures may need to be moved (reuse of the anchor to achieve listed load values is not recommended)

Codes: ICC-ES ESR-2713 (concrete); ICC-ES ESR-1056 (masonry); City of L.A. RR25741 (concrete), RR25560 (masonry); Florida FL-15730.6; FM 3017082, 3035761 and 3043442; Multiple DOT listings

Material: Carbon steel

Coating: Zinc plated or mechanically galvanized

Installation

- Holes in metal fixtures to be mounted should match the diameter specified in the table below. Use a Titen HD® screw anchor one time only — installing the anchor multiple times may result in excessive thread wear and reduce load capacity.
- Do not use impact wrenches to install into hollow CMU.
- Caution:** Oversized holes in base material will reduce or eliminate the mechanical interlock of the threads with the base material and reduce the anchor's load capacity.

1. Drill a hole in the base material using a carbide drill bit the same diameter as the nominal diameter of the anchor to be installed. Drill the hole to the specified embedment depth plus minimum hole depth overall (see table below right) to allow the thread tapping dust to settle, and blow it clean using compressed air. (Overhead installations need not be blown clean.) Alternatively, drill the hole deep enough to accommodate embedment depth and the dust from drilling and tapping.
2. Insert the anchor through the fixture and into the hole.
3. Tighten the anchor into the base material until the hex-washer head contacts the fixture.

Installation Sequence

Additional Installation Information

Titen HD® Diameter (in.)	Wrench Size (in.)	Recommended Fixture Hole Size (in.)	Min. Hole Depth Overdrill (in.)
1/4	3/8	3/8 to 7/16	1/8
3/8	9/16	1/2 to 9/16	1/4
1/2	3/4	5/8 to 11/16	1/2
5/8	15/16	3/4 to 13/16	1/2
3/4	1 1/8	7/8 to 15/16	1/2

**Titen HD®
Screw Anchor**
U.S. Patents 5,674,035
and 6,623,228

Serrated teeth on the tip of the Titen HD® screw anchor facilitate cutting and reduce installation torque.

**NEW 1/4" Titen HD®
Screw Anchor**

Pullout Resistance, Cracked Concrete (<i>f'_c</i> =2,500 psi)	<i>N_{p,cr}</i>	lb.	— ³	1,905 ⁴	1,235 ⁴	2,700 ⁴	— ³	— ³	3,260 ⁴	5,570 ⁴	6,070 ⁴	7,195 ⁴
Strength Reduction Factor — Concrete Pullout Failure	<i>φ_p</i>	—	0.65 ⁵									
Breakout or Pullout Strength in Tension for Seismic Applications⁸												
Nominal Pullout Strength for Seismic Loads (<i>f'_c</i> =2,500 psi)	<i>N_{p,eq}</i>	lb.	— ³	1,905 ⁴	1,235 ⁴	2,700 ⁴	— ³	— ³	3,260 ⁴	5,570 ⁴	6,070 ⁴	7,195 ⁴
Strength Reduction Factor — Breakout or Pullout Failure	<i>φ_{eq}</i>	—	0.65 ⁵									

- The information presented in this table is to be used in conjunction with the design criteria of ACI 318 Appendix D, except as modified below.
- The value of *φ* applies when the load combinations of ACI 318 Section 9.2 are used. If the load combinations of ACI 318 Appendix C are used, refer to Section D.4.4 to determine the appropriate value of *φ*. Anchors are considered brittle steel elements.
- Pullout strength is not reported since concrete breakout controls.
- Adjust the characteristic pullout resistance for other concrete compressive strengths by multiplying the tabular value by (*f'_{c,specified}* / 2,500)^{0.5}.
- The value of *φ* applies when both the load combinations of ACI 318 Section 9.2 are used and the requirements of Section D.4.3(c) for Condition B are met. If the load combinations of ACI 318 Appendix C are used, refer to Section D.4.4 to determine the appropriate value of *φ*.
- The modification factor *ψ_{cp,N}* = 1.0 for cracked concrete. Otherwise, the modification factor for uncracked concrete without supplementary reinforcement to control splitting is either:

$$(1) \psi_{cp,N} = 1.0 \text{ if } c_{a,min} \geq c_{ac} \text{ or } (2) \psi_{cp,N} = \frac{c_{a,min}}{c_{ac}} \geq \frac{1.5h_{ef}}{c_{ac}} \text{ if } c_{a,min} < c_{ac}$$

The modification factor, *ψ_{cp,N}* is applied to the nominal concrete breakout strength, *N_{cb}* or *N_{cbg}*.

- The value of *φ* applies when both the load combinations of ACI 318 Section 9.2 are used and the requirements of Section D.4.3(c) for Condition B are met. If the load combinations of ACI 318 Section 9.2 are used and the requirements of Section D.4.3(c) for Condition A are met, refer to Section D.4.3 to determine the appropriate value of *φ*. If the load combinations of ACI 318 Appendix C are used, refer to Section D.4.4 to determine the appropriate value of *φ*.
- For sand-lightweight concrete, in lieu of ACI 318 Section D.3.6, modify the value of concrete breakout strength, *N_{p,cr}*, *N_{p,un-cr}* and *N_{eq}* by 0.6. All-lightweight concrete is beyond the scope of this table.
- Data for 1/4" anchor is valid only for THDB25 series. Data for 5/8" anchor is valid only for THDB62 series.

Mechanical Anchors

Pullout Resistance, concrete on metal deck (cracked) ^{2,3,4}	$N_{p,deck,cr}$	lb.	420	535	375	870	905	2,040	655	1,195	500	1,700
Pullout Resistance, concrete on metal deck (uncracked) ^{2,3,4}	$N_{p,deck,uncr}$	lb.	995	1,275	825	1,905	1,295	2,910	1,555	2,850	1,095	2,430
Steel Strength in Shear, concrete on metal deck ⁵	$V_{sa,deck}$	lb.	1,335	1,745	2,240	2,395	2,435	4,430	2,010	2,420	4,180	7,145
Steel Strength in Shear, Seismic	$V_{sa,deck,eq}$	lb.	870	1,135	1,434	1,533	1,556	2,846	1,305	1,575	2,676	4,591

- The information presented in this table is to be used in conjunction with the design criteria of ACI 318 Appendix D, except as modified below.
- Concrete compressive strength shall be 3,000 psi minimum. The characteristic pullout resistance for greater compressive strengths shall be increased by multiplying the tabular value by $(f'_{c,specified} / 3,000)^{0.5}$.
- For anchors installed in the soffit of sand-lightweight or normal-weight concrete over metal deck floor and roof assemblies, as shown in Figure 1 and Figure 2, calculation of the concrete breakout strength may be omitted.
- In accordance with ACI 318 Section D.5.3.2, the nominal pullout strength in cracked concrete for anchors installed in the soffit of sand-lightweight or normal-weight concrete over metal deck floor and roof assemblies $N_{p,deck,cr}$

- shall be substituted for $N_{p,cr}$. Where analysis indicates no cracking at service loads, the normal pullout strength in uncracked concrete $N_{p,deck,uncr}$ shall be substituted for $N_{p,uncr}$.
- In accordance with ACI 318 Section D.6.1.2(c), the shear strength for anchors installed in the soffit of sand-lightweight or normal-weight concrete over metal deck floor and roof assemblies $V_{sa,deck}$ and $V_{sa,deck,eq}$ shall be substituted for V_{sa} .
- Minimum edge distance to edge of panel is $2h_{ef}$.
- The minimum anchor spacing along the flute must be the greater of $3h_{ef}$ or 1.5 times the flute width.
- Data for $\frac{1}{4}$ " anchor is valid only for THDB25 series.

Titen HD® Anchor Tension and Shear Strength Design Data in the Topside of Normal-Weight Concrete or Sand-Lightweight Concrete over Metal Deck

Design Information	Symbol	Units	Nominal Anchor Diameter, d_a	
			Figure 3	Figure 2
			$\frac{1}{4}$ "	$\frac{3}{8}$ "
Nominal Embedment Depth	h_{nom}	in.	1 $\frac{1}{8}$	2 $\frac{1}{2}$
Effective Embedment Depth	h_{ef}	in.	1.19	1.77
Minimum Concrete Thickness	$h_{min,deck}$	in.	2 $\frac{1}{2}$	3 $\frac{1}{4}$
Critical Edge Distance	$c_{ac,deck,top}$	in.	3 $\frac{3}{4}$	7 $\frac{1}{4}$
Minimum Edge Distance	$c_{min,deck,top}$	in.	3 $\frac{1}{2}$	3
Minimum Spacing	$s_{min,deck,top}$	in.	3 $\frac{1}{2}$	3

- For anchors installed in the topside of concrete-filled deck assemblies, as shown in Figures 2 and 3, the nominal concrete breakout strength of a single anchor or group of anchors in shear, V_{cp} or V_{cbg} , respectively, must be calculated in accordance with ACI 318 D.6.2, using the actual member thickness, $h_{min,deck}$, in the determination of A_{vc} .
- Design capacity shall be based on calculations according to values in the tables featured on pages 185 and 186.
- Minimum flute depth (distance from top of flute to bottom of flute) is 1 $\frac{1}{2}$ inch (see Figures 2 and 3).
- Steel deck thickness shall be minimum 20 gauge.
- Minimum concrete thickness ($h_{min,deck}$) refers to concrete thickness above upper flute (see Figures 2 and 3).

Figure 1. Installation of $\frac{3}{8}$ " and $\frac{1}{2}$ " Diameter Anchors in the Soffit of Concrete over Metal Deck

Figure 2. Installation of $\frac{3}{8}$ " Diameter Anchors in the Topside and $\frac{1}{4}$ " Diameter Anchors in the Soffit of Concrete over Metal Deck

Figure 3. Installation of $\frac{1}{4}$ " Diameter Anchors in the Topside of Concrete over Metal Deck

* See page 12 for an explanation of the load table icons.

1. Tension design strengths are based on the strength design provisions of ACI 318-11 Appendix D.
2. Tabulated values are for a single anchor with no influence of another anchor.
3. Interpolation between embedment depths is not permitted.
4. Strength reduction factor, ϕ , is based on using a load combination from ACI 318-11 Section 9.2.
5. The tension design strength listed for SDC (Seismic Design Category) A-B may also be used in SDC C-F when the tension component of the strength-level seismic design load on the anchor does not exceed 20% of the total factored tension load on the anchor associated with the same load combination.
6. When designing anchorages in SDC C-F, the designer shall consider the ductility requirements of ACI 318-11 Section D.3.3.
7. Tension design strengths in SDC C-F have been adjusted by 0.75 factor in accordance with ACI 318-11 Section D.3.3.4.4.

- The allowable loads listed are based on a safety factor of 4.0.
- Refer to allowable load-adjustment factors for spacing and edge distance on pages 198 and 199.
- The minimum concrete thickness is 1 1/2 times the embedment depth.
- Tension and shear loads for the Titen HD anchor may be combined using the elliptical interaction equation (n=5/6). Allowable load may be interpolated for concrete compressive strengths between 2,000 psi and 4,000 psi.

		4 5/8 (117)			11,222 (49.9)	2,900 (12.9)	2,805 (12.5)	4,490 (20.0)	24,680 (109.8)	2,368 (10.5)	6,170 (27.4)
		5 3/4 (146)			19,793 (88.0)	3,547 (15.8)	4,950 (22.0)	5,560 (24.7)	24,680 (109.8)	795 (3.5)	6,170 (27.4)

- The allowable loads listed are based on a safety factor of 4.0.
- Refer to allowable load-adjustment factors for spacing and edge distance on pages 198 and 199.
- The minimum concrete thickness is 1 1/2 times the embedment depth.
- Tension and shear loads for the Titen HD anchor may be combined using the elliptical interaction equation (n=5/6). Allowable load may be interpolated for concrete compressive strengths between 2,000 psi and 4,000 psi.

* See page 12 for an explanation of the load table icons.

Titen HD® Design Information — Concrete

Titen HD® Allowable Shear Loads in Normal-Weight Concrete, Load Applied Parallel to Concrete Edge   *

Size in. (mm)	Drill Bit Dia. in.	Embed. Depth in. (mm)	Minimum Edge Dist. in. (mm)	Minimum End Dist. in. (mm)	Minimum Spacing Dist. in. (mm)	Shear Load Based on Concrete Edge Distance		
						f'c ≥ 2,500 psi (17.2 MPa) Concrete		
						Ultimate lb. (kN)	Std. Dev. lb. (kN)	Allowable lb. (kN)

		3 1/2 (89)				7,060 (31.4)	1,284 (5.7)	1,765 (7.9)

Note: Rebar not shown for clarity.

1. The allowable loads listed are based on a safety factor of 4.0.
2. The minimum concrete thickness is 1 1/2 times the embedment depth.

Titen HD® Allowable Tension Loads in Normal-Weight Concrete Stemwall   *

Size in. (mm)	Drill Bit Dia. in.	Embed. Depth in. (mm)	Stemwall Width in. (mm)	Min. Edge Dist. in. (mm)	Min. End Dist. in. (mm)	Tension Load			
						f'c ≥ 2,500 psi (17.2 MPa) Concrete		f'c ≥ 4,500 psi (31.0 MPa) Concrete	
						Ultimate lb. (kN)	Allow. lb. (kN)	Ultimate lb. (kN)	Allow. lb. (kN)
1/2 (12.7)	1/2	10 (254)	6 (152)	1 3/4 (45)	8 (203)	15,420 (68.6)	3,855 (17.1)	20,300 (90.3)	5,075 (22.6)
					4 3/8 (111)	14,280 (63.5)	3,570 (15.9)	19,040 (84.7)	4,760 (21.2)

1. The allowable loads are based on a safety factor of 4.0.
2. The minimum anchor spacing is 15 inches.
3. The minimum concrete thickness (depth) is 12 inches.
4. Allowable loads may be interpolated for compressive strengths between 2,500 and 4,500 psi.

Titen HD® Allowable Tension Loads in Normal-Weight Concrete, Load Applied at 60° Angle to Horizontal for Tilt-Up Wall Braces   *

Size in. (mm)	Drill Bit Dia. in.	Embed. Depth in. (mm)	Tension Applied at 60 degrees to Horizontal		
			f'c ≥ 2,500 psi (17.2 MPa) Concrete		
			Ultimate lb. (kN)	Std. Dev. lb. (kN)	Allow. lb. (kN)
5/8 (15.9)	5/8	5 (127)	13,420 (59.7)	1,273 (5.7)	3,355 (14.9)
3/4 (19.1)	3/4	5 (127)	15,180 (67.5)	968 (4.3)	3,795 (16.9)

1. The allowable loads are based on a safety factor of 4.0.
2. Anchor must be installed into a concrete floor slab, footing, or deadman with sufficient area, weight, and strength to resist the anchorage load.
3. Titen HD® has been qualified for temporary outdoor use of up to 90 days through testing for this application.

The Titen HD® screw anchor 3/4" x 6" and 3/4" x 7" (models THDT75600H and THD75700H) have a 1" section under the head that is unthreaded to allow installation into tilt-up wall braces.

* See page 12 for an explanation of the load table icons.

Titen HD® Design Information — Concrete

Titen HD® Allowable Tension and Shear Loads in Sand-Lightweight Concrete over Metal Deck

Mechanical Anchors

Size in. (mm)	Drill Bit Dia. in.	Embed. Depth in. (mm)	Critical Edge Dist. in. (mm)	Critical Spacing Dist. in. (mm)	Install in Concrete (see Figure below)				Install through Metal Deck (see Figure below)			
					Tension Load		Shear Load		Tension Load		Shear Load	
					$f'_c \geq 3,000$ psi (20.7 MPa) Lightweight Concrete		$f'_c \geq 3,000$ psi (20.7 MPa) Lightweight Concrete		$f'_c \geq 3,000$ psi (20.7 MPa) Lightweight Concrete		$f'_c \geq 3,000$ psi (20.7 MPa) Lightweight Concrete	
					Ultimate lb. (kN)	Allowable lb. (kN)	Ultimate lb. (kN)	Allowable lb. (kN)	Ultimate lb. (kN)	Allowable lbs. (kN)	Ultimate lb. (kN)	Allowable lb. (kN)
3/8 (9.5)	3/8	2 3/4 (70)	6 (152)	6 (152)	2,560 (11.4)	640 (2.8)	4,240 (18.9)	1,060 (4.7)	—	—	—	—
		3 (76)			—	—	—	—	5,420 (24.1)	1,355 (6.0)	4,100 (18.2)	1,025 (4.6)
1/2 (12.7)	1/2	2 3/4 (70)	8 (203)	8 (203)	3,040 (13.5)	760 (3.4)	6,380 (28.4)	1,595 (7.1)	—	—	—	—
		4 (102)			—	—	—	—	7,020 (31.2)	1,755 (7.8)	6,840 (30.4)	1,710 (7.6)
5/8 (15.9)	5/8	2 3/4 (70)	10 (254)	10 (254)	3,100 (13.8)	775 (3.4)	6,380 (28.4)	1,595 (7.1)	—	—	—	—
		5 (127)			—	—	—	—	8,940 (39.8)	2,235 (9.9)	10,700 (47.6)	2,675 (11.9)

- The allowable loads listed are based on a safety factor of 4.0.
- Allowable loads for anchors installed in the lower flute of the steel deck are for flutes with a trapezoidal profile with a depth of 3 inches, and a width varying from 4 1/2 inches at the bottom to 7 1/2 inches at the top. The spacing of the flutes is 12 inches. The metal deck must be minimum 20-gauge with a minimum yield strength of 38 ksi and minimum ultimate strength of 45 ksi.
- Anchors may be installed off-center in the lower flute (up to 1 1/2" from the edge of the lower flute) without a load reduction.
- 100% of the allowable load is permitted at critical edge distance and critical spacing. Testing at smaller edge distances and spacings has not been performed.

Titen HD® screw anchor installed in the top and bottom of a structural sand-lightweight-concrete and metal-deck assembly

* See page 12 for an explanation of the load table icons.

Figure 4. Shaded Area = Placement for Full and Reduced Allowable Load Capacity in Grout-Filled CMU

1. The tabulated allowable loads are based on a safety factor of 5.0 for installations under the IBC and IRC.
2. Values for 8-inch-wide, lightweight, medium-weight and normal-weight concrete masonry units.
3. The masonry units must be fully grouted.
4. The minimum specified compressive strength of masonry, f'_m , at 28 days is 1,500 psi.
5. Embedment depth is measured from the outside face of the concrete masonry unit.
6. Allowable loads may be increased 33 1/3% for short-term loading due to wind or seismic forces where permitted by code.
7. Grout-filled CMU wall design must satisfy applicable design standards and be capable of withstanding applied loads.
8. Refer to allowable load-adjustment factors for spacing and edge distance on page 200.

Titen HD® Allowable Tension and Shear Loads
in 8" Lightweight, Medium-Weight and
Normal-Weight Hollow CMU

Size in. (mm)	Drill Bit Dia. in.	Embed. Depth ⁴ in. (mm)	Min. Edge Dist. in. (mm)	Min. End Dist. in. (mm)	8-inch Hollow CMU Loads Based on CMU Strength			
					Tension Load		Shear Load	
					Ultimate lb. (kN)	Allowable lb. (kN)	Ultimate lb. (kN)	Allowable lb. (kN)
Anchor Installed in Face Shell (See Figure 5)

Figure 5

1. The tabulated allowable loads are based on a safety factor of 5.0 for installations under the IBC and IRC.
2. Values for 8-inch-wide, lightweight, medium-weight and normal-weight concrete masonry units.
3. The minimum specified compressive strength of masonry, f'_m , at 28 days is 1,500 psi.
4. Embedment depth is measured from the outside face of the concrete masonry unit and is based on the anchor being embedded an additional 1/2" through 1 1/4" thick face shell.
5. Allowable loads may not be increased for short-term loading due to wind or seismic forces. CMU wall design must satisfy applicable design standards and be capable of withstanding applied loads.
6. Do not use impact wrenches to install in hollow CMU.
7. Set drill to rotation-only mode when drilling into hollow CMU.

* See page 12 for an explanation of the load table icons.

Titen HD® Design Information — Masonry

Titen HD® Allowable Tension and Shear Loads in 8" Lightweight, Medium-Weight and Normal-Weight Grout-Filled CMU Stemwall

Size in. (mm)	Drill Bit Dia. in.	Embed. Depth in. (mm)	Min. Edge Dist. in. (mm)	Min. End Dist. in. (mm)	Critical Spacing Dist. in. (mm)	8-inch Grout-Filled CMU Allowable Loads Based on CMU Strength					
						Tension		Shear Perp. to Edge		Shear Parallel to Edge	
						Ultimate lb. (kN)	Allowable lb. (kN)	Ultimate lb. (kN)	Allowable lb. (kN)	Ultimate lb. (kN)	Allowable lb. (kN)
Anchor Installed in Cell Opening or Web (Top of Wall) (See Figure 6)											
½ (12.7)	½	4½ (114)	1¼ (45)	8 (203)	8 (203)	2,860 (12.7)	570 (2.5)	800 (3.6)	160 (0.7)	2,920 (13.0)	585 (2.6)
⅝ (15.9)	⅝	4½ (114)	1¼ (45)	10 (254)	10 (254)	2,860 (12.7)	570 (2.5)	800 (3.6)	160 (0.7)	3,380 (15.0)	675 (3.0)

1. The tabulated allowable loads are based on a safety factor of 5.0 for installations under the IBC and IRC.
2. Values are for 8-inch-wide, lightweight, medium-weight and normal-weight concrete masonry units.
3. The masonry units must be fully grouted.
4. The minimum specified compressive strength of masonry, f'_m , at 28 days is 1,500 psi.
5. Allowable loads may be increased 33⅓% for short-term loading due to wind or seismic forces where permitted by code.
6. Grout-filled CMU wall design must satisfy applicable design standards and be capable of withstanding applied design loads.
7. Loads are based on anchor installed in either the web or grout-filled cell opening in the top of wall.

Figure 6. Anchor Installed in top of wall

Mechanical Anchors

* See page 12 for an explanation of the load table icons.

Titen HD® Design Information — Concrete

Load Adjustment Factors for Titen HD® Anchors in Normal-Weight Concrete:
Edge Distance, Tension and Shear Loads

How to use these charts:

1. The following tables are for reduced edge distance.
2. Locate the anchor size to be used for either a tension and/or shear load application.
3. Locate the anchor embedment (E) used for either a tension and/or shear load application.
4. Locate the edge distance (c_{act}) at which the anchor is to be installed.
5. The load adjustment factor (f_c) is the intersection of the row and column.
6. Multiply the allowable load by the applicable load adjustment factor(s).
7. Reduction factors for multiple edges are multiplied together.

Edge Distance Tension (f_c)

Edge Dist. c_{act} (in.)	Dia.	3/8			1/2			5/8			3/4

8 1/2											0.94	0.94	0.94
9											1.00	1.00	1.00

The tabled adjustment values (f_c) have been calculated using the following information:

1. E = Embedment depth (inches).
2. c_{act} = actual edge distance at which anchor is installed (inches).
3. c_{cr} = critical edge distance for 100% load (inches).
4. c_{min} = minimum edge distance for reduced load (inches).
5. f_c = percent of allowable load at actual edge distance.
6. $f_{c_{cr}}$ = percentage of allowable load at critical edge distance. $f_{c_{cr}}$ is always = 1.00.
7. $f_{c_{min}}$ = percent of allowable load at minimum edge distance.
8. $f_c = f_{c_{min}} + [(1 - f_{c_{min}}) (c_{act} - c_{min}) / (c_{cr} - c_{min})]$.

* See page 12 for an explanation of the load table icons.

Titen HD® Design Information — Concrete

Load Adjustment Factors for Titen HD® Anchors in Normal-Weight Concrete: Edge Distance, Tension and Shear Loads

How to use these charts:

1. The following tables are for reduced edge distance.
2. Locate the anchor size to be used for either a tension and/or a shear load application.
3. Locate the anchor embedment (E) used for either a tension and/or a shear load application.
4. Locate the edge distance (s_{act}) at which the anchor is to be installed.
5. The load adjustment factor (f_s) is the intersection of the row and column.
6. Multiply the allowable load by the applicable load adjustment factor(s).
7. Reduction factors for multiple edges are multiplied together.

Spacing Tension (f_s)

s_{act} (in)	Dia.	$\frac{3}{8}$			$\frac{1}{2}$			$\frac{5}{8}$			$\frac{3}{4}$		
	E	1½	2¼	3¾	2¼	3½	5¼	2¼	4½	5¼	2¼	4½	5¼

10								1.00	1.00	1.00	0.95	0.95	0.95
11											0.97	0.97	0.97
12											1.00	1.00	1.00

The tabled adjustment values (f_s) have been calculated using the following information:

1. E = Embedment depth (inches).
2. s_{act} = actual spacing distance at which anchors are installed (inches).
3. s_{cr} = critical spacing distance for 100% load (inches).
4. s_{min} = minimum spacing distance for reduced load (inches).
5. f_s = adjustment factor for allowable load at actual spacing distance.
6. $f_{s_{cr}}$ = adjustment factor for allowable load at critical spacing distance. $f_{s_{cr}}$ is always = 1.00.
7. $f_{s_{min}}$ = adjustment factor for allowable load at minimum spacing distance.
8. $f_s = f_{s_{min}} + [(1 - f_{s_{min}}) (s_{act} - s_{min}) / (s_{cr} - s_{min})]$.

* See page 12 for an explanation of the load table icons.

Titen HD® Design Information — Masonry

Load-Adjustment Factors for Titen HD® Anchors in Face-of-Wall Installation in 8" Grout-Filled CMU: Edge Distance and Spacing, Tension and Shear Loads

How to use these charts:

- The following tables are for reduced edge distance and spacing.
- Locate the anchor size to be used for either a tension and/or shear load application.
- Locate the embedment (E) at which the anchor is to be installed.
- Locate the edge distance (C_{act}) or spacing (S_{act}) at which the anchor is to be installed.
- The load adjustment factor (f_c or f_s) is the intersection of the row and column.
- Multiply the allowable load by the applicable load adjustment factor.
- Reduction factors for multiple edges or spacings are multiplied together.

Edge or End Distance Tension (f_c)

C_{act} (in.)	Dia.	3F8	½	5F8	3F4
	E	4½	3½	4½	4½
	C_{cr}	12	12	12	12
	C_{min}	4	4	4	4
	f_{cmin}	1.00	1.00	0.83	0.66
4		1.00	1.00	0.83	0.66
6		1.00	1.00	0.87	0.75
8		1.00	1.00	0.92	0.83
10		1.00	1.00	0.96	0.92
12		1.00	1.00	1.00	1.00

See notes below

Edge or End Distance Shear (f_c) Shear Load Perpendicular to Edge or End (Directed Towards Edge or End)

C_{act} (in.)	Dia.	¾	½	5/8	¾
	E	2¾	3½	4½	5½
	C_{cr}	12	12	12	12
	C_{min}	4	4	4	4
	f_{cmin}	0.58	0.38	0.30	0.21
4		0.58	0.38	0.30	0.21
6		0.69	0.54	0.48	0.41
8		0.79	0.69	0.65	0.61
10		0.90	0.85	0.83	0.80
12		1.00	1.00	1.00	1.00

- E = Embedment depth (inches).
- C_{act} = actual end or edge distance at which anchor is installed (inches).
- C_{cr} = critical end or edge distance for 100% load (inches).
- C_{min} = minimum end or edge distance for reduced load (inches).
- f_c = adjustment factor for allowable load at actual end or edge distance.
- f_{ccr} = adjustment factor for allowable load at critical end or edge distance.
 f_{ccr} is always = 1.00.
- f_{cmin} = adjustment factor for allowable load at minimum end or edge distance.
- $f_c = f_{cmin} + [(1 - f_{cmin})(C_{act} - C_{min}) / (C_{cr} - C_{min})]$.

Spacing Tension (f_s)

S_{act} (in.)	Dia.	¾	½	5/8	¾
	E	2¾	3½	4½	5½
	S_{cr}	6	8	10	12
	S_{min}	3	4	5	6
	f_{smin}	0.87	0.69	0.59	0.50
3		0.87			
4		0.91	0.69		
5		0.96	0.77	0.59	
6		1.00	0.85	0.67	0.50
8			1.00	0.84	0.67
10				1.00	0.83
12					1.00

- E = Embedment depth (inches).
- S_{act} = actual spacing distance at which anchors are installed (inches).
- S_{cr} = critical spacing distance for 100% load (inches).
- S_{min} = minimum spacing distance for reduced load (inches).
- f_s = adjustment factor for allowable load at actual spacing distance.
- f_{scr} = adjustment factor for allowable load at critical spacing distance. f_{scr} is always = 1.00.
- f_{smin} = adjustment factor for allowable load at minimum spacing distance.
- $f_s = f_{smin} + [(1 - f_{smin})(S_{act} - S_{min}) / (S_{cr} - S_{min})]$.

* See page 12 for an explanation of the load table icons.

Edge and End Distance Shear (f_c) Shear Load Parallel to Edge or End

C_{act} (in.)	Dia.	¾	½	5/8	¾
	E	2¾	3½	4½	4½
	C_{cr}	12	12	12	12
	C_{min}	4	4	4	4
	f_{cmin}	0.77	0.48	0.46	0.44
4		0.77	0.48	0.46	0.44
6		0.83	0.61	0.60	0.58
8		0.89	0.74	0.73	0.72
10		0.94	0.87	0.87	0.86
12		1.00	1.00	1.00	1.00

See notes below

Edge or End Distance Shear (f_c) Shear Load Perpendicular to Edge or End (Directed Away From Edge or End)

C_{act} (in.)	Dia.	¾	½	5/8	¾
	E	2¾	3½	4½	5½
	C_{cr}	12	12	12	12
	C_{min}	4	4	4	4
	f_{cmin}	0.89	0.79	0.58	0.38
4		0.89	0.79	0.58	0.38
6		0.92	0.84	0.69	0.54

10				1.00	0.87
12					1.00

Titen HD® Rod Coupler

The Titen HD® Rod Coupler is designed to be used in conjunction with a single or multi-story rod tie-down system. This anchor provides a fast and simple way to attach threaded rod to a concrete stem wall or thickened slab footing. Unlike adhesive anchors, the installation requires no special tools, cure time or secondary setting process; just drill a hole and drive the anchor.

Features

- The serrated cutting teeth and patented thread design enable the Titen HD Rod Coupler to be installed quickly and easily. Less installation time translates to lower installed cost
- The specialized heat treating process creates tip hardness to facilitate cutting while the body remain ductile
- No special setting tools are required. The Titen HD Rod Coupler installs with regular or hammer drill, ANSI size bits and standard sockets
- Compatible with threaded rods in $\frac{3}{8}$ " and $\frac{1}{2}$ " diameters

Material: Carbon steel

Coating: Zinc plated

Installation

Caution: Oversized holes in the base material will reduce or eliminate the mechanical interlock of the threads with base material and will reduce the anchor's load capacity. Use a Titen HD® Rod Coupler one time only. Installing the anchor multiple times may result in excessive thread wear and reduce load capacity.

1. Drill a hole using the specified diameter carbide bit into the base material to a depth of at least $\frac{1}{2}$ " deeper than the required embedment.
2. Blow the hole clean of dust and debris using compressed air. Overhead application need not be blown clean.
3. Tighten the anchor with appropriate size socket until the head sits flush against base material.

Titen HD® Rod Coupler
U.S. Patent
5,674,035 & 6,623,228

Installation Sequence:

Titen HD® Rod Coupler

Titen HD® Rod Coupler Product Data

Size (in)	Model No.	Accepts Rod Dia. (in.)	Drill Bit Dia. (in)	Wrench Size (in)	Quantity	
					Box	Carton
3/8 x 6 3/4	THD37634RC	3/8	3/8	9/16	50	100
1/2 x 9 3/4	THD50934RC	1/2	1/2	3/4	20	40

Titen HD® Rod Coupler Allowable Tension Loads in Normal-Weight Concrete Stemwall

Size in. (mm)	Drill Bit Dia. in.	Embed. Depth in. (mm)	Stemwall Width in. (mm)	Minimum Edge Dist. in. (mm)	Minimum End Dist. in. (mm)	Minimum Spacing Dist. in. (mm)	Tension Load Based on Concrete Strength		Tension Load Based on Connected Rod Strength
							$f'_c \geq 2500$ psi (17.2 MPa) Concrete		A307 (SAE 1018)
							Ultimate lb. (kN)	Allowable lb. (kN)	Allowable lb. (kN)
3/8 (9.5)	3/8	5 (127)	8 (203)	1 3/4 (45)	10 (254)	20 (508)	8,900 (39.6)	2,225 (9.9)	2,105 (9.4)
1/2 (12.7)	1/2	8 (203)	8 (203)	1 3/4 (45)	16 (406)	32 (813)	15,540 (69.1)	3,885 (17.3)	3,750 (16.7)

1. Allowable load must be the lesser of the concrete or steel strength.
2. The allowable loads based on concrete strength are based on a factor of safety of 4.0.
3. The allowable load based on steel strength is limited by the strength of the coupler nut supplied with this anchor. Use of higher strength rod will not increase allowable loads.
4. The minimum concrete thickness is 1.5 times the embedment depth.
5. Tension and shear loads may be combined using the straight-line interaction equation ($n=1$).

Titen HD® Rod Coupler Allowable Shear Loads in Normal-Weight Concrete Stemwall, Load Applied Parallel to Concrete Edge

Size in. (mm)	Drill Bit Dia. in.	Embed. Depth in. (mm)	Stemwall Width in. (mm)	Minimum Edge Dist. in. (mm)	Minimum End Dist. in. (mm)	Minimum Spacing Dist. in. (mm)	Shear Load Based on Conc. Edge Dist.	
							$f'_c \geq 2500$ psi (17.2 MPa) Concrete	
							Ultimate lb. (kN)	Allowable lb. (kN)
1/2 (12.7)	1/2	8 (203)	8 (203)	1 3/4 (45)	16 (406)	32 (813)	6,200 (27.6)	1,550 (6.9)

1. Install with a washer (not supplied with anchor) when used to resist shear loads.
2. The allowable load based on concrete edge distance is based on a factor of safety of 4.0. Steel strength does not control.
3. The minimum concrete thickness is 1.5 times the embedment depth.
4. Tension and shear loads may be combined using the straight-line interaction equation ($n=1$).

* See page 12 for an explanation of the load table icons.

Titen® Concrete and Masonry Screw

Titen® screws are hardened screws for attaching all types of components to concrete and masonry. These fasteners are commonly used in applications such as attaching electrical boxes, light fixtures or window frames into concrete or masonry base materials.

Features

- Available in 3/16" and 1/4" diameter sizes
- Available in hex and Phillips flat-head designs in two colors
- Drill bit included with each box

Material: Carbon steel

Coating: Zinc plated with a baked-on ceramic coating

Codes: Florida FL-2355.1

Installation

Caution: Industry studies show that hardened fasteners can experience performance problems in wet or corrosive environments. Steps must be taken to prevent inadvertent sustained loads above the listed allowable loads. Overtightening and bending moments can initiate cracks detrimental to the hardened screw's performance. Use the Simpson Strong-Tie installation tool kit. It is designed to reduce the potential for overtightening the screw.

Caution: Oversized holes in the base material will reduce or eliminate the mechanical interlock of the threads with the base material and will reduce the anchor's load capacity.

1. Drill a hole in the base material using the appropriate diameter carbide drill bit as specified in the table. Drill the hole to the specified embedment depth plus 1/2" to allow the thread tapping dust to settle and blow it clean using compressed air. Overhead installations need not be blown clean. Alternatively, drill the hole deep enough to accommodate embedment depth and dust from drilling and tapping.
2. Position fixture, insert screw and tighten using drill and installation tool fitted with a hex socket or phillips bit.

Preservative-treated wood applications: suitable for use in non-ammonia formulations of CCA, ACQ-C, ACQ-D, CA-B, BX/DOT and zinc borate. Use in dry, interior environments only.

Use caution not to damage ceramic barrier coating during installation. Recommendations are based on testing and experience at time of publication and may change. Simpson Strong-Tie cannot provide estimates on service life of screws.

1. Maximum anchor embedment is 1 1/2" (38.1 mm).
2. Concrete must be minimum 1.5 x embedment.

* See page 12 for an explanation of the load table icons.

Titen® Stainless Steel Concrete and Masonry Screw

Stainless Steel Titen® screws are ideal for attaching various types of components to concrete and masonry, such as fastening electrical boxes or light fixtures. They offer the versatility of our standard Titen screws with enhanced corrosion protection. Available in hex and Phillips flat head.

Features

- Suitable for concrete, brick, grout-filled CMU and hollow-block applications
- Suitable for some preservative-treated wood applications
- Acceptable for exterior use
- Titen drill bits included in each box
- Available in lengths from 1 1/4"-4"

Material: Type 410 stainless steel

Coating: Zinc plated with a protective overcoat

Installation

Caution: Industry studies show that hardened fasteners can experience performance problems in wet or corrosive environments. Steps must be taken to prevent inadvertent sustained loads above the listed allowable loads. Overtightening and bending moments can initiate cracks detrimental to the hardened screw's performance. Use the Simpson Strong-Tie Titen installation tool kit as it has a bit that is designed to reduce the potential for overtightening the screw.

Caution: Oversized holes in the base material will reduce or eliminate the mechanical interlock of the threads with the base material and will reduce the anchor's load capacity.

1. Drill a hole in the base material using the appropriate diameter carbide drill bit as specified in the table. Drill the hole to the specified embedment depth plus 1/2" to allow the thread tapping dust to settle and blow it clean using compressed air. Overhead installations need not be blown clean. Alternatively, drill the hole deep enough to accommodate embedment depth and dust from drilling and tapping.
2. Position fixture, insert screw and tighten using drill and Titen screw installation tool fitted with a hex socket or phillips bit.

Preservative-treated wood applications: suitable for use in non-ammonia formulations of CCA, ACQ-C, ACQ-D, CA-B, SBX/DOT and zinc borate. Acceptable for use in exterior environments. Use caution not to damage coating during installation. The 410 stainless-steel Titen with top coat provides "medium" corrosion protection. Recommendations are based on testing and experience at time of publication and may change. Simpson Strong-Tie cannot provide estimates on service life of screws.

Titen® Screw – Installation Accessories

Titen® Screw – Installation Tool

The Simpson Strong-Tie® Titen® screw installation kit makes installation of Titen screws quick and easy. Accessories are compatible with a standard three-jaw style chuck, and the sockets have been designed to prevent over-torquing, which can lead to fastener failure. Comes packaged in a rugged plastic box ideal for storage of the installation kit and Titen screws.

Eight-piece kit includes:

- Drill bit holder
- Phillips bit socket
- 5/8" sleeve
- #2 and #3 Phillips bits
- 1/4" and 5/16" hex sockets
- Allen wrench

Titen drivers are sold individually.

Titen HD® Threaded Rod Hanger

The Titen HD® threaded rod hanger is a high-strength screw anchor designed to suspend threaded rod from concrete slabs and beams or concrete over metal in order to hang pipes, cable trays and HVAC equipment. The anchor offers low installation torque with no secondary setting, and has been tested to offer industry-leading performance in cracked and uncracked concrete – even in seismic loading conditions.

Features

- Thread design undercuts to efficiently transfer the load to the base material
- Serrated cutting teeth and patented thread design enable quick and easy installation
- Specialized heat-treating process creates tip hardness to facilitate cutting while the anchor body remains ductile
- Designed to install using a rotary hammer or hammer drill with standard ANSI drill bits – no special tools required
- Installs with standard-sized sockets
- The THD50234RH and THD37212RH are code listed for cracked and uncracked concrete applications under the 2012 and 2009 IBC/IRC, per ICC-ES ESR-2713

Codes: ICC-ES ESR-2713 (THD37212RH and THD50234RH); City of L.A. RR25741; Florida FL-15730.6; Factory Mutual 3031136 (THD50234RH and THD37218RH) and 3035761 (THD37212RH)

Material: Carbon steel

Coating: Zinc plated

Installation

- Caution:** Oversized holes in the base material will reduce or eliminate the mechanical interlock of the threads with base material and will reduce the anchor's load capacity.
- Caution:** Use a Titen HD® Rod Hanger one time only. Installing the anchor multiple times may result in excessive thread wear and reduce load capacity.
1. Drill a hole using the specified diameter carbide bit into the base material to a depth of at least ½" deeper than the required embedment.
 2. Blow the hole clean of dust and debris using compressed air.
 3. **IMPORTANT:** Install with an applied torque of 15 ft-lbs for the THD25112RH and THD37218RH rod hangers using a torque wrench, driver drill, hammer drill or cordless ¼" impact driver with a maximum permitted torque rating of 100 ft-lb.

Nominal Pullout Strength for Seismic Loads ($f'_c = 2,500$ psi)	$N_{p,eq}$	lb.	1,235 ³	1,235 ³
Strength Reduction Factor – Pullout Failure ⁴	ϕ_{eq}	—	0.65	

- The information presented in this table is to be used in conjunction with the design criteria of ACI 318 Appendix D, except as modified below.
- The value of ϕ applies when the load combinations of ACI 318 Section 9.2 are used. If the load combinations of ACI 318 Appendix C are used, refer to Section D.4.4 to determine the appropriate value of ϕ . Anchors are considered brittle steel elements.
- Adjust the characteristic pullout resistance for other concrete compressive strengths by multiplying the tabular value by $(f'_{c,specified}/2,500)^{0.5}$.
- The value of ϕ applies when both the load combinations of ACI 318 Section 9.2 are used and the requirements of Section D.4.3(c) for Condition B are met. If the load combinations of ACI 318 Appendix C are used, refer to Section D.4.4 to determine the appropriate value of ϕ .

- The value of ϕ applies when both the load combinations of ACI 318 Section 9.2 are used and the requirements of Section D.4.3(c) for Condition B are met. If the load combinations of ACI 318 Section 9.2 are used and the requirements of Section D.4.3(c) for Condition A are met, refer to Section D.4.3 to determine the appropriate value of ϕ . If the load combinations of ACI 318 Appendix C are used, refer to Section D.4.4 to determine the appropriate value of ϕ .
- For sand-lightweight concrete, the modification factor for concrete breakout strength must be taken as 0.6. Additionally, the pullout strength $N_{p,uncr}$, $N_{p,cr}$ and $N_{p,eq}$ must be multiplied by 0.6, as applicable.
- For sand-lightweight concrete, in lieu of ACI 318 Section D.3.6, modify the value of concrete breakout strength, $N_{p,cr}$, $N_{p,uncr}$ and $N_{p,eq}$ by 0.6. All-lightweight concrete is beyond the scope of this table.

* See page 12 for an explanation of the load table icons.

Titen HD® Rod Hanger Design Information – Concrete

Titen HD® Threaded Rod Hanger Tension Strength Design Data for Installations in the Lower and Upper Flute of Normal-Weight or Sand-Lightweight Concrete Through Metal Deck^{1,2,5,6}

Characteristic	Symbol	Units	Model No.	
			THD37212RH	THD50234RH
Minimum Hole Depth	h_{hole}	in.	3	3¼
Embedment Depth	h_{nom}	in.	2½	2¾
Effective Embedment Depth	h_{ef}	in.	1.77	1.77
Pullout Resistance – Cracked Concrete ^{2,3,4}	$N_{p,deck,cr}$	lbf.	870	870
Pullout Resistance – Uncracked Concrete ^{2,3,4}	$N_{p,deck,uncr}$	lbf.	1,430	1,430

- The information presented in this table is to be used in conjunction with the design criteria of ACI 318 Appendix D, except as modified below.
- Concrete compressive strength shall be 3,000 psi minimum. The characteristic pullout resistance for greater compressive strengths shall be increased by multiplying the tabular value by $(f'_c / 3,000 \text{ psi})^{0.5}$.
- For anchors installed in the soffit of sand-lightweight or normal-weight concrete over metal deck floor and roof assemblies, as shown in Figure 1, calculation of the concrete breakout strength may be omitted.
- In accordance with ACI 318 Section D.5.3.2, the nominal pullout strength in cracked concrete for anchors installed in the soffit of sand-lightweight or normal-weight-concrete-over-metal-deck floor and roof assemblies $N_{p,deck,cr}$ shall be substituted for $N_{p,cr}$. Where analysis indicates no cracking at service loads, the normal pullout strength in uncracked concrete $N_{p,deck,uncr}$ shall be substituted for $N_{p,uncr}$.
- Minimum distance to edge of panel is $2h_{ef}$.
- The minimum anchor spacing along the flute must be the greater of $3h_{ef}$ or 1.5 times the flute width.

Figure 1. Installation in Concrete Over Metal Deck

Titen HD® Threaded Rod Hanger Allowable Tension Loads in Normal-Weight Concrete

Model Number	Rod Hanger Dia. (in.)	Drill Bit Dia. (in.)	Emb. Depth (in.)	Critical Edge Distance (in.)	Critical Spacing Distance (in.)	Tension Load			
						$f'_c \geq 2,000$ psi Concrete		$f'_c \geq 4,000$ psi Concrete	
						Ultimate (lb.)	Allowable (lb.)	Ultimate (lb.)	Allowable (lb.)
THD25112RH	¼	¼	1½	3	6	1,319	330	2,102	525
THD37218RH	¾	¼	2½	3	6	2,210	555	3,227	805
THD37212RH	¾	¾	2½	3	6	3,650	915	5,275	1,320
THD50234RH	½	¾	2¾	3	6	4,297	1,075	6,204	1,550

- The allowable loads listed are based on a safety factor of 4.0.
- Allowable loads may not be increased for short-term loading due to wind or seismic forces.
- Refer to allowable load-adjustment factors for spacing and edge distance on pages 198 and 199.
- The minimum concrete thickness is 1½ times the embedment depth.
- Allowable load may be interpolated for concrete compressive strengths between 2,000 psi and 4,000 psi.

* See page 12 for an explanation of the load table icons.

Wood Rod Hanger Threaded Rod Anchor System

Simpson Strong-Tie's wood rod hanger is a one-piece fastening system for suspending 1/4" or 3/8" threaded rod. Vertical rod hangers are designed to suspend threaded rod in overhead applications from wood members. Horizontal rod hangers are available for applications requiring installation into the side of joists, columns and overhead members. Both rod hangers provide attachment points for use in pipe hanging, fire protection, electrical conduit and cable-tray applications. Recommended for use in dry, interior, non-corrosive environments only.

Features

- Threaded anchors for rod-hanging applications in wood
- Suitable for installation horizontally or vertically in overhead applications
- No pre-drilling required
- Easily installed with a drill or screw gun
- Type-17 tip provides for fast starts
- UL/FM Listed

Material: Carbon steel

Coating: Zinc plated

2. Allowable loads may not be increased for short-term loading.
3. Allowable loads are based on a factor of safety of 5.0.
4. Mechanical and plumbing design codes may prescribe lower allowable loads. Verify with local codes.
5. Allowable loads are based on Douglas Fir-Larch (DF), Southern Pine (SP) and Spruce-Pine-Fir (SPF) wood members having a minimum specific gravity of 0.50, 0.55 and 0.42, respectively.

Installation Sequence

1. Attach RND62 nut driver to a drill.
2. Insert rod hanger into the RND62 nut driver.
3. Using rotation-only mode, drive rod hanger until it contacts the surface. Do not over-tighten. RND62 nut driver will disengage the rod hanger at the appropriate depth to prevent over-driving.
4. Insert threaded rod. Minimum thread engagement should be equal to the nominal diameter of the threaded insert.

Blue Banger Hanger® Cast-In-Place, Internally Threaded Insert

Wood-Form Insert

Multi-thread, cast-in-place wood-form and metal-deck inserts for cracked and uncracked concrete maximize jobsite efficiency and reduce inventory commitment. Also available in metal-roof-deck insert version, offering a low-profile design that does not interfere with roofing material.

Features

- Code listed under the IBC/IRC in accordance with AC446 for cracked and uncracked concrete applications, per ICC-ES ESR-3707
- Multi-thread design allows insert to accept multiple rod diameters
- Blue plastic ring acts as an insert locator when forms are removed
- Plastic ring creates a countersunk recess to keep internal threads clean from concrete residue
- Nails snap off with a hammer strike after the forms are removed

Material: Carbon steel

Coating: Yellow zinc dichromate coating

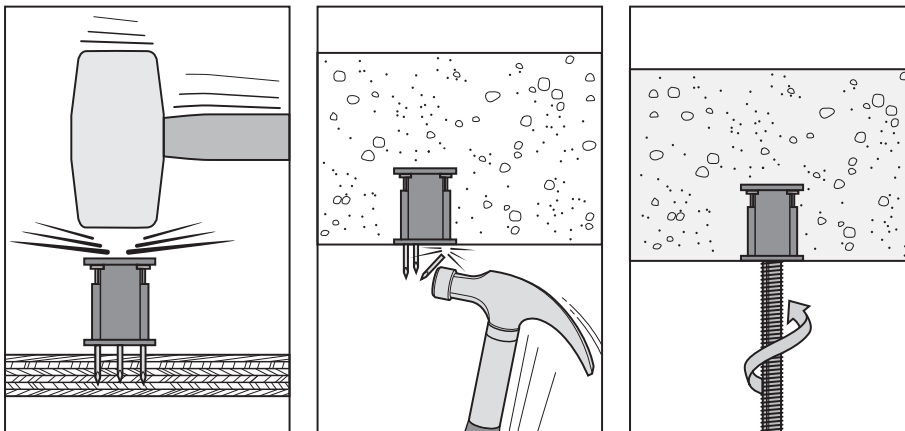

Codes: ICC-ES ESR-3707; Factory Mutual 3024378 (see pipe size limit tables); Underwriters Laboratories File Ex3605 (see pipe size limit tables)

Installation

1. Strike the top of the hanger and drive the 3 mounting nails into the forming material until the bottom of the hanger is flush with the bottom of the plywood. The hanger should be sitting 90° from the forming material.
2. Once concrete is hardened and forms are stripped, strike the mounting nails to break them off.
3. Insert the rod into the sleeve and thread it into the hanger.

Installation Sequence

Patented multi-thread design allows one product to handle up to three rod diameters.

Product Data

Hanger Type	For Rod Diameter (in)	Model Number	Carton Qty.
Wood-Form Insert	1/4, 3/8, 1/2	BBWF2550	200
	3/8, 1/2, 5/8	BBWF3762	150
	5/8, 3/4	BBWF6275	150

Blue Banger Hanger® Cast-In-Place, Internally Threaded Insert

Metal-Deck Insert

Features

- Code-listed under the IBC/IRC in accordance with AC446 for cracked and uncracked concrete applications, per ICC-ES ESR-3707
- Multi-thread design allows insert to accept multiple rod diameters
- Compression spring keeps insert perpendicular to deck, even if bumped or stepped on after installation
- 3" plastic sleeve keeps internal threads clean and provides guidance to align threaded rod with the internal threads
- Extended sleeve length allows easy location of insert even with fireproofing on the underside of the deck
- Installed height of 2" allows insert to be used on top of or between deck flutes

Material: Carbon steel

Coating: Yellow zinc dichromate coating

Codes: ICC-ES ESR-3707; Factory Mutual 3024378 (see pipe size limit tables); Underwriters Laboratories File Ex3605 (see pipe size limit tables)

Installation

1. Drill a hole in the metal deck using the appropriate diameter bit as referenced in the table.
2. Insert the hanger in the hole and strike the top so that the plastic sleeve is forced through the hole and expands against the bottom side of the deck. The anchor can also be installed by stepping on it.
3. Insert the rod into the sleeve and thread it into the hanger.

Mechanical Anchors

Installation Sequence

Patented multi-thread design allows one product to handle up to three rod diameters.

Product Data

Hanger Type	For Rod Diameter (in)	Deck Hole Diameter (in)	Model Number	Carton Qty.
Metal-Deck Insert	1/4, 3/8, 1/2	13/16 - 7/8	BBMD2550	100
	3/8, 1/2, 5/8	1 1/8 - 1 3/16	BBMD3762	50
	5/8, 3/4	1 3/16 - 1 1/4	BBMD6275	50

Blue Banger Hanger® Cast-In-Place, Internally Threaded Insert

Metal-Roof-Deck Insert

Features

- Multi-thread design: The insert accepts three different rod diameters
- Low-profile design does not interfere with roofing material
- Positive attachment to the roof deck prevents spinning and keeps the hanger in position
- Pre-staked, self-drilling screws allow quick installation

Material: Carbon steel

Coating: Yellow zinc dichromate coating

Installation

1. Drill a hole in the metal deck using the appropriate diameter bit as referenced in the table.
2. Insert the hanger into the hole and fasten to the deck with the two pre-staked screws provided.
3. Insert the rod into the sleeve and thread it into the hanger.

Blue Banger Hanger® Design Information — Concrete

Wood-Form Insert: Tension and Shear Strength Design Data^{1,2,3,4,5,6,8}

Design Information	Symbol	Units	Model No.		
			BBWF2550	BBWF3762	BBWF6275
Insert outside diameter ⁷	d_a	in.	0.811	1.00	1.102
Effective embedment depth	h_{ef}	in.	1.875	1.954	1.875
Insert steel characterization	—	—	Non-ductile		
Modification factor for insert tension strength for inserts located in a region of a concrete member where analysis indicates no cracking at service load levels	$\Psi_{c,N}$	—	1.25	1.25	1.25
Nominal tension strength of single insert in tension as governed by steel strength	$N_{sa,insert}$	lb.	8,415	16,755	18,685
Nominal seismic tension strength of single insert in tension as governed by steel strength	$N_{sa,insert,eq}$	lb.	7,695	8,195	7,695
Nominal steel shear strength of single insert	V_{sa}	lb.	6,810	8,210	8,760
Nominal steel shear strength of single insert for seismic loading	$V_{sa,eq}$	lb.	6,810	8,210	8,760

- Concrete must be normal-weight or lightweight concrete with f'_c of 3,000 psi minimum.
- Only the largest size of threaded rod specified for each insert must be used for applications resisting shear loads.
- Design of headed cast-in specialty inserts shall be in accordance with the provisions of ACI 318 Appendix D for cast-in headed anchors. The value of k_c shall be in accordance with the value for cast-in anchors in D.5.2.2.
- Strength reduction factors shall be taken from ACI 318-11 D.4.3 for cast-in headed anchors.
- Strength reduction factor for load combinations of ACI 318 Section 9.2 governed by steel strength shall be taken as 0.65 for tension and 0.60 for shear.
- The concrete tension strength of headed cast-in specialty inserts shall be calculated in accordance with ACI 318 Appendix D.
- Insert outside diameter = outside diameter of plastic sleeve.
- The strengths shown in the table are for inserts only. Design professional is responsible for checking threaded rod strength in tension, shear and combined tension and shear, as applicable.

Metal-Deck Insert: Tension and Shear Strength Design Data^{1,2,3,4,5,6,8}

3/4	14,530	18,790	31,315	15,030	30,060	27,555	31,315	14,280

1. Tension design strength must be the lesser of the concrete or threaded rod strength.
2. Tension design strengths are based on the strength design provisions of ACI 318-11 Appendix D.
3. Tabulated values are for a single anchor with no influence of another anchor.
4. Strength reduction factor, ϕ , is based on using a load combination from ACI 318-11 Section 9.2.
5. The tension design strength listed for SDC (Seismic Design Category) A-B may also be used in SDC C-F when the tension component of the strength-level seismic design load on the anchor does not exceed 20% of the total factored tension load on the anchor associated with the same load combination.
6. When designing anchorages in SDC C-F, the designer shall consider the ductility requirements of ACI 318-11 Section D.3.3.
7. Tension design strengths in SDC C-F have been adjusted by 0.75 factor in accordance with ACI 318-11 Section D.3.3.4.4.

Wood-Form Insert: Allowable Tension Loads in Normal-Weight Concrete ($f'_c = 3,000$ psi) — Static Load

3/8	2,405	3,115	5,195	2,495	4,980	4,570	5,195	2,365
1/2	4,410	5,705	9,510	4,565	9,130	8,370	9,510	4,335
5/8	7,025	9,080	15,135	7,265	14,530	13,320	15,135	6,900
3/4	10,380	13,420	22,370	10,735	21,470	19,680	22,370	10,200

1. Allowable tension load must be the lesser of the concrete or threaded rod steel load.
2. Allowable tension loads are calculated based on the strength design provision of ACI 318-11 Appendix D using a conversion factor of $\alpha = 1.4$. The conversion factor α is based on the load combination $1.2D + 1.6L$ assuming 50% dead load and 50% live load: $1.2(0.5) + 1.6(0.5) = 1.4$.
3. Tabulated values are for a single anchor with no influence of another anchor.
4. Installation must comply with Figure 1 on page 223.

* See page 12 for an explanation of the load table icons.

1. Allowable tension load must be the lesser of the concrete or threaded rod steel load.
2. Allowable tension loads are calculated based on the strength design provision of ACI 318-11 Appendix D using a conversion factor of $\alpha = 1/6.7 = 1.43$. The conversion factor α is based on the load combination assuming 100% seismic load.
3. Tabulated values are for a single anchor with no influence of another anchor.
4. The allowable tension load listed for SDC (Seismic Design Category) A-B may also be used in SDC C-F when the tension component of the strength-level seismic design load on the anchor does not exceed 20% of the total factored tension load on the anchor associated with the same load combination.
5. When designing anchorages in SDC C-F, the designer shall consider the ductility requirements of ACI 318-11 Section D.3.3.
6. Tension design strengths in SDC C-F have been adjusted by 0.75 factor in accordance with ACI 318-11 Section D.3.3.4.4.
7. Installation must comply with Figure 1 on page 223.

* See page 12 for an explanation of the load table icons.

Drop-In Internally Threaded Anchor (DIAB)

Expansion shell anchors for use in solid base materials

Simpson Strong-Tie introduces a new, redesigned Drop-In Anchor (DIAB) that provides easier installation into base materials. Improved geometry in the preassembled expansion plug improves setting capability so the anchor installs with 40% fewer hammer strikes than previous versions. These displacement-controlled expansion anchors are easily set by driving the plug toward the bottom of the anchor using either the hand- or power-setting tools. DIAB anchors feature a positive-set marking indicator at the top of the anchor — helping you see more clearly when proper installation has taken place.

Use a Simpson Strong-Tie fixed-depth stop bit to take the guesswork out of drilling to the correct depth. The fluted design of the tip draws debris away from the hole during drilling, allowing for a cleaner installation.

Key features

- New design offers easier installation than previous drop-in anchor design – sets with 40% fewer hammer hits
- Positive-set marking system indicates when anchor is properly set
- Lipped drop-in version available for flush installation
- Hand- and power-setting tools available for fast, easy and economical installation
- Fixed-depth stop bit helps you drill to the correct depth every time

Material: Carbon steel

Coating: Zinc plated

Fixed-Depth Drill Bit

Drop-In Internally Threaded Anchor (DIAB)

DIAB Manual Installation

⚠ Caution: Oversized holes will reduce the anchors load capacity

1. Drill a hole in the base material using the appropriate diameter carbide drill bit or fixed depth bit as specified in the table. Drill the hole to the specified embedment. For fixed depth bits drill the hole until the shoulder of the bit contacts the surface of the base material. Then blow the hole clean of dust and debris using compressed air. Overhead installations need not be blown clean.
2. Insert the anchor into the hole. Tap with hammer until flush against the surface.
3. Using the designated Drop-In setting tool, drive expander plug towards the bottom of the anchor until the shoulder of the setting tool makes contact with the top of the anchor. When properly set 4 indentations will be visible on the top of the anchor indicating full expansion.
4. Insert bolt or threaded rod. Minimum thread engagement should be equal to the nominal diameter of the threaded insert.

DIAB SDS Installation

⚠ Caution: Oversized holes will reduce the anchors load capacity

1. Drill a hole in the base material using the appropriate diameter carbide drill bit or fixed depth drill bit as specified in the table. Drill the hole to the specified embedment. For fixed depth bits drill the hole until the shoulder of the bit contacts the surface of the base material. Then blow the hole clean of dust and debris using compressed air. Overhead installations need not be blown clean.
2. Insert the anchor into the hole. Tap with hammer until flush against the surface.
3. Attach SDS Drop-In setting tool a drill. Drive expander plug towards the bottom of the anchor using only hammer mode until the shoulder of the setting tool makes contact with the top of the anchor. When properly set 4 indentations will be visible on the top of the anchor indicating full expansion.
4. Insert bolt or threaded rod. Minimum thread engagement should be equal to the nominal diameter of the threaded insert.

1. The allowable loads listed are based on a safety factor of 4.0.
2. Refer to allowable load-adjustment factors for edge distance and spacing on page 228.
3. Allowable loads may be linearly interpolated between concrete strength listed.
4. The minimum concrete thickness is 1 ½ times the embedment depth.
5. Allowable loads may not be increased for short-term loading due to wind or seismic forces.

DIAB Allowable Tension and Shear Loads in Soffit of Sand-Lightweight Concrete over Metal Deck

Model No.	Rod Size in. (mm)	Drill Bit Dia. In.	Embed Depth In. (mm)	Critical End Dist. ⁶ In. (mm)	Critical Spacing In. (mm)	$f'_c \geq 3,000$ psi (20.7 MPa)			
						Tension Load		Shear Load	
						Ultimate lb. (kN)	Allowable lb. (kN)	Ultimate lb. (kN)	Allowable lb. (kN)
DIAB37 DIABL37	⅜ (9.5)	½	1⅞ (40)	4½ (114)	6 (152)	2,895 (12.9)	725 (3.2)	3,530 (15.7)	885 (3.9)
DIAB50 DIABL50	½ (12.7)	⅝	2 (51)	6 (152)	8 (203)	4,100 (18.2)	1,025 (4.6)	4,685 (20.8)	1,170 (5.2)

1. The allowable loads listed are based on a safety factor of 4.0.
2. Allowable loads may not be increased for short-term loading due to wind or seismic forces.
3. Refer to allowable load-adjustment factors for edge distance and spacing on page 228.
4. Anchors were installed in the center of the bottom flute of the steel deck.
5. Metal deck must be minimum 20-gauge thick with minimum yield strength of 33 ksi.
6. Critical end distance is defined as the distance from end of the slab in the direction of the flute.

Lightweight Concrete over Metal Deck

* See page 12 for an explanation of the load table icons.

Drop-In (DIAB) Design Information — Concrete

Allowable Load-Adjustment Factors for Drop-In Anchor (DIAB) in Normal-Weight Concrete and Sand-Lightweight Concrete over Metal Deck: Edge Distance and Spacing, Tension and Shear Loads

How to use these charts:

- The following tables are for reduced edge distance and spacing.
- Locate the anchor size to be used for either a tension and/or a shear load application.
- Locate the edge distance (C_{act}) or spacing (S_{act}) at which the anchor is to be installed.

- The load adjustment factor (f_c or f_s) is the intersection of the row and column.
- Multiply the allowable load by the applicable load adjustment factor.
- Reduction factors for multiple edges or spacing are multiplied together.

Edge Distance Tension (f_c)

Edge Dist. C_{act} (in.)	Size	1/4	3/8	1/2	5/8	3/4
		C_{cr}	3	4 1/2	6	7 1/2
	C_{min}	1 3/4	2 5/8	3 1/2	4 3/8	5 1/4
	f_{cmin}	0.77	0.77	0.77	0.77	0.77
1 3/4		0.77				
2		0.82				
2 1/2		0.91				
2 5/8		0.93	0.77			
3		1.00	0.82			
3 1/2			0.88	0.77		
4			0.94	0.82		
4 3/8			0.98	0.85	0.77	
4 1/2			1.00	0.86	0.78	
5				0.91	0.82	
5 1/4				0.93	0.83	0.77
5 1/2				0.95	0.85	0.79
6				1.00	0.89	0.82
6 1/2					0.93	0.85
7					0.96	0.88
7 1/2					1.00	0.91
8						0.94
8 1/2						0.97
9						1.00

- C_{act} = actual edge distance at which anchor is installed (inches).
- C_{cr} = critical edge distance for 100% load (inches).
- C_{min} = minimum edge distance for reduced load (inches).
- f_c = adjustment factor for allowable load at actual edge distance.
- f_{ocr} = adjustment factor for allowable load at critical edge distance. f_{ocr} is always = 1.00.
- f_{cmin} = adjustment factor for allowable load at minimum edge distance.
- $f_c = f_{cmin} + [(1 - f_{cmin})(C_{act} - C_{min}) / (C_{cr} - C_{min})]$.

Edge Distance Shear (f_c)

Edge Dist. C_{act} (in.)	Size	1/4	3/8	1/2	5/8	3/4
		C_{cr}	3	4 1/2	6	7 1/2
	C_{min}	1 3/4	2 5/8	3 1/2	4 3/8	5 1/4
	f_{cmin}	0.54	0.54	0.64	0.64	0.64
1 3/4		0.54				
2		0.63				
2 1/2		0.82				
2 5/8		0.86	0.54			
3		1.00	0.63			
3 1/2			0.75	0.64		
4			0.88	0.71		
4 3/8			0.97	0.77	0.64	
4 1/2			1.00	0.78	0.65	
5				0.86	0.71	
5 1/4				0.89	0.74	0.64
5 1/2				0.93	0.77	0.66
6				1.00	0.83	0.71
6 1/2					0.88	0.76
7					0.94	0.81
7 1/2					1.00	0.86
8						0.90
8 1/2						0.95
9						1.00

- C_{act} = actual edge distance at which anchor is installed (inches).
- C_{cr} = critical edge distance for 100% load (inches).
- C_{min} = minimum edge distance for reduced load (inches).
- f_c = adjustment factor for allowable load at actual edge distance.
- f_{ocr} = adjustment factor for allowable load at critical edge distance. f_{ocr} is always = 1.00.
- f_{cmin} = adjustment factor for allowable load at minimum edge distance.
- $f_c = f_{cmin} + [(1 - f_{cmin})(C_{act} - C_{min}) / (C_{cr} - C_{min})]$.

Spacing Tension (f_s)

Spacing S_{act} (in.)	Size	1/4	3/8	1/2	5/8	3/4
		S_{cr}	4	6	8	10
	S_{min}	1 1/2	2 1/4	3	3 3/4	4 3/4

11						1.00
11 1/2						1.00
12						1.00
12 1/2						1.00

- S_{act} = actual spacing distance at which anchor is installed (inches).
- S_{cr} = critical spacing distance for 100% load (inches).
- S_{min} = minimum spacing distance for reduced load (inches).
- f_s = adjustment factor for allowable load at actual spacing distance.
- f_{ocr} = adjustment factor for allowable load at critical spacing distance. f_{ocr} is always = 1.00.
- f_{smin} = adjustment factor for allowable load at minimum spacing distance.
- $f_s = f_{smin} + [(1 - f_{smin})(S_{act} - S_{min}) / (S_{cr} - S_{min})]$.

* See page 12 for an explanation of the load table icons.

Drop-In Internally Threaded Anchor (DIA)

Drop-in anchors are internally threaded drop-in expansion anchors for use in flush-mount applications in solid base materials. Available in stainless steel (DIA), short (DIAS) or coil-thread (DIAC) versions. Minimum thread engagement should be equal to the nominal diameter of the threaded insert.

Features

- Lipped edge (DIAS) eliminates need for precisely drilled hole depth
- Available in coil-thread version for 1/2" and 3/4" coil-threaded rod
- Short length (DIAS) enables shallow embedment to help avoid drilling into rebar or pre-stressed/post-tensioned cables
- Short Drop-In anchors include a setting tool compatible with the anchor to ensure consistent installation

Material: Carbon and stainless steel

Coating: Carbon steel; zinc plated

Codes: Drop-in: DOT; Factory Mutual 3017082; Underwriters Laboratories File Ex3605. Meets requirements of Federal Specifications A-A-55614, Type I.

Short drop-in: Factory Mutual 3017082 and Underwriters Laboratories File Ex3605.

Caution: The load tables list values based upon results from the most recent testing and may not reflect those in current code reports. Where code jurisdictions apply, consult the current reports for applicable load values.

Installation

1. Drill a hole in the base material using the appropriate diameter carbide drill bit as specified in the table. Drill the hole to the specified embedment depth plus 1/8" for flush mounting. Blow the hole clean using compressed air. Overhead installations need not be blown clean.
2. Insert designated anchor into hole. Tap with hammer until flush against surface.
3. Using the designated drop-in setting tool, drive expander plug toward the bottom of the anchor until shoulder of setting tool makes contact with the top of the anchor.
4. Minimum thread engagement should be equal to the nominal diameter of the threaded insert.

Caution: Oversized holes will make it difficult to set the anchor and will reduce the anchor's load capacity.

Drop-In (DIA) Design Information — Concrete

Allowable Load-Adjustment Factors for Drop-In (Stainless Steel), Coil Thread (Carbon Steel) and Short Drop-In Anchors in Normal-Weight Concrete: Edge Distance and Spacing, Tension and Shear Loads

How to use these charts:

1. The following tables are for reduced edge distance and spacing.
2. Locate the anchor size to be used for either a tension and/or shear load application.
3. Locate the edge distance (c_{act}) or spacing (s_{act}) at which the anchor is to be installed.
4. The load adjustment factor (f_c or f_s) is the intersection of the row and column.
5. Multiply the allowable load by the applicable load adjustment factor.
6. Reduction factors for multiple edges or spacing are multiplied together.

Edge Distance Tension (f_c)

Edge Dist. c_{act} (in.)	Size	1/4	3/8	1/2	5/8	3/4
	c_{cr}	3	4 1/2	6	7 1/2	9

1. E = Embedment depth (inches).
2. s_{act} = actual spacing distance at which anchors are installed (inches).
3. s_{cr} = critical spacing distance for 100% load (inches).
4. s_{min} = minimum spacing distance for reduced load (inches).
5. f_s = adjustment factor for allowable load at actual spacing distance.
6. f_{scr} = adjustment factor for allowable load at critical spacing distance. f_{scr} is always = 1.00.
7. f_{smin} = adjustment factor for allowable load at minimum spacing distance.
8. $f_s = f_{smin} + [(1 - f_{smin})(s_{act} - s_{min}) / (s_{cr} - s_{min})]$.
9. 3/8" short drop-in (DIA37S).
10. 1/2" short Drop-in (DIA50S)

1. c_{act} = actual edge distance at which anchor is installed (inches).
2. c_{cr} = critical edge distance for 100% load (inches).
3. c_{min} = minimum edge distance for reduced load (inches).
4. f_c = adjustment factor for allowable load at actual edge distance.
5. f_{ccr} = adjustment factor for allowable load at critical edge distance. f_{ccr} is always = 1.00.
6. f_{cmin} = adjustment factor for allowable load at minimum edge distance.
7. $f_c = f_{cmin} + [(1 - f_{cmin})(c_{act} - c_{min}) / (c_{cr} - c_{min})]$.

* See page 12 for an explanation of the load table icons.

Drop-In (DIA) Design Information — Concrete

Allowable Load-Adjustment Factors for Short Drop-in Anchors in Sand-Lightweight Concrete over Metal Deck: Edge Distance and Spacing, Tension and Shear Loads

How to use these charts:

1. The following tables are for reduced edge distance and spacing.
2. Locate the anchor size to be used for either a tension and/or shear load application.
3. Locate the edge distance (c_{act}) or spacing (s_{act}) at which the anchor is to be installed.
4. The load adjustment factor (f_c or f_s) is the intersection of the row and column.
5. Multiply the allowable load by the applicable load adjustment factor.
6. Reduction factors for multiple edges or spacing are multiplied together.

Hollow Drop-In Internally Threaded Anchor

The Simpson Strong-Tie® Hollow Drop-In Anchor (HDIA) is an internally threaded, flush-mount expansion anchor for use in hollow materials such as CMU and hollow-core plank, as well as in solid base materials such as brick, normal-weight and lightweight concrete.

Features:

- Suitable for suspending conduit, cable trays, pipe supports, fire sprinklers and suspended lighting into concrete
- Expansion design allows HDIA to anchor into CMU, hollow-core plank, brick, normal-weight concrete and lightweight concrete
- Internally threaded anchor allows for easy bolt removal

Material: Die-cast Zamac 3 alloy shell with carbon-steel cone or 304 stainless-steel cone

Codes: Factory Mutual 3053987 (3/8"–1/2" diameter)
Underwriters Laboratories EX3605 (3/8"–1/2" diameter)

Hollow Drop-In Internally Threaded Anchor

Installation Instructions — Solid Base (using solid setting tool)

- Drill a hole in the base material using the appropriate diameter carbide drill bit as specified in the table. Drill the hole to the specified embedment depth.
- Blow the hole clean using compressed air. Overhead installations need not be blown clean.
- Insert the HDIA into hole. Tap with hammer until flush against surface.
- Using the designated setting tool, drive the anchor to the bottom of the drilled hole. After the anchor reaches the bottom of the drilled hole, perform an additional 3 hammer blows against the setting tool to drive the anchor body over the cone.
- Position fixture; insert fastener and tighten.

Installation Instructions — Hollow Base (using hollow setting tool)

- Drill a hole in the base material using the appropriate diameter carbide drill bit as specified in the table.
- Thread the HDIA onto the designated setting tool for hollow base materials.
- Insert the HDIA into the hole. Tap the setting tool until the face of the tool contacts the surface.
- Rotate the setting tool a minimum of 2 turns to set the anchor.
- Remove the setting tool.
- Position fixture; insert fastener and tighten.

Hollow Drop-In Design Information — Concrete and Masonry

Allowable Tension Loads for Hollow Drop-In Anchor in Normal-Weight Concrete

Model No.	Size in. (mm)	Drill Bit Dia. in. (mm)	Embed Depth in. (mm)	Critical Edge Dist. in. (mm)	Critical Spacing in. (mm)	Tension Load			
						$f'_c \geq 2,500$ psi (17.2 MPa)		$f'_c \geq 4,000$ psi (27.6 MPa)	
						Ultimate lb. (kN)	Allowable lb. (kN)	Ultimate lb. (kN)	Allowable lb. (kN)
HDA25, HDIA25SS	1/4 (6.4)	3/8 (9.5)	7/8 (22)	2 5/8 (67)	3 1/2 (89)	1,180 (5.2)	295 (1.3)	1,220 (5.4)	305 (1.4)
HDA31	5/16 (7.9)	5/8 (15.9)	1 1/2 (38)	4 1/2 (114)	6 (152)	3,000 (13.3)	750 (3.3)	3,420 (15.2)	855 (3.8)
HDA37, HDIA37SS	3/8 (9.5)	5/8 (15.9)	1 1/2 (38)	4 1/2 (114)	6 (152)	3,000 (13.3)	750 (3.3)	3,420 (15.2)	855 (3.8)
HDA50	1/2 (12.7)	3/4 (19.1)	2 (51)	6 (152)	8 (203)	4,260 (18.9)	1,065 (4.7)	5,500 (24.5)	1,375 (6.1)
HDA62	5/8 (15.9)	1 (25.4)	2 1/4 (57)	6 3/4 (171)	9 (229)	6,100 (27.1)	1,525 (6.8)	6,300 (28.0)	1,575 (7.0)

1. The allowable loads listed are based on a safety factor of 4.0.
2. The minimum concrete thickness is 1 1/2 times the embedment depth.
3. Allowable loads may be linearly interpolated between concrete strengths listed.

Allowable Shear Loads for Hollow Drop-In Anchor in Normal-Weight Concrete

Model No.	Size in. (mm)	Drill Bit Dia. in. (mm)	Embed Depth in. (mm)	Critical Edge Dist. in. (mm)	Critical Spacing in. (mm)	Shear Load Based on Anchor Strength		Shear Load Based on Steel Strength	
						$f'_c \geq 2,500$ psi (17.2 MPa)		F1554 Grade 36	A193 Grade B7

HDA50	1/2 (12.7)	3/4 (19.1)	1 3/4 (44)	4 (102)	4 5/8 (117)	8 (203)	1,525 (6.8)	305 (1.4)	2,300 (10.2)	460 (2.0)
HDA62	5/8 (15.9)	1 (25.4)	2 (51)	4 (102)	4 5/8 (117)	8 (203)	1,525 (6.8)	305 (1.4)	2,325 (10.3)	465 (2.1)

1. The allowable loads listed are based on a safety factor of 5.0.
2. Values for 8-inch wide lightweight, medium-weight, and normal-weight CMU.
3. The minimum specified compressive strength of masonry, f'_m , at 28 days with a minimum face shell thickness of 1 1/4" is 1,500 psi.
4. The installed end of the anchor may extend into the CMU cavity depending upon face shell thickness.

* See page 12 for an explanation of the load table icons.

LSES Lag Screw Expansion Shield

The Lag Screw Expansion Shield is a die-cast zinc alloy expansion shield for anchoring lag screws in a variety of base materials, including concrete, concrete block, brick and mortar joints. Radial ribs provide additional holding power in softer material.

Material: Die-cast Zamac 3 alloy

Installation

Caution: Oversized holes may make it impossible to set the anchor and will reduce the anchor's load capacity.

1. Drill a hole in the base material using the appropriate diameter carbide drill bit as specified in the table. Drill the hole to the specified embedment depth plus 1/8" for flush mounting and blow it clean using compressed air. Alternatively, drill the hole deep enough to accommodate embedment depth and dust from drilling. Overhead installations need not be blown clean.
2. Insert anchor into hole. Tap with hammer until flush with surface of base material.
3. Position fixture, insert screw and tighten.

2. The minimum concrete thickness is 1 1/2 times the embedment depth.
3. Screw is not included.

Installation Sequence

* See page 12 for an explanation of the load table icons.

ESA Expansion Screw Anchor

The ESA was the original internally threaded mechanical anchor design. The malleable lead shield allows for secure mounting.

Material: Cone: Die-cast Zamac 3 alloy; expander shield: 3–5% antimonial lead

Code: Meets Federal Specifications A-A-1922A, Type 1, except ESA50.

Installation

1. Drill a hole in the base material using the appropriate-diameter carbide drill bit as specified in the table. Drill the hole to the specified embedment depth plus 1/8" for flush mounting. Blow the hole clean using compressed air. Overhead installations need not be blown clean.
2. Insert anchor into hole.
3. Using a piloted setting punch, drive expander shield over cone.
4. Position fixture, insert fastener and tighten.

Zinc Nail™ Pin Drive Anchors

Zinc Nail™ anchors are low-cost, easy-to-install anchors for applications under static loads.

Features

- Available with carbon and stainless-steel pins
- Pin and head configuration designed to make anchor tamper-resistant

Materials

- Body – Die-cast Zamac 3 alloy
- Pin – Carbon steel; Type 304 stainless steel

Code: Meets Federal Specification A-A-1925A, Type 1

Installation

-  **Caution:** Not for use in overhead applications.
-  **Caution:** Nailon anchors are not recommended for eccentric tension (prying) loads — capacity will be greatly reduced in such applications

1. Drill a hole in base material using a carbide drill bit the same diameter as the nominal diameter of the anchor to be installed. Drill the hole to specified embedment depth, plus ¼" for pin extension, and blow hole clean using compressed air. Alternatively, drill the hole deep enough to accommodate embedment depth and dust from drilling.
2. Position fixture and insert Nailon anchor.
3. Tap with hammer until flush with fixture, then drive pin until flush with top of head.

1/4	1/4	3/4	780	765	195	190
		1 1/2	1,050	1,050	265	265

1. The allowable loads are based on a safety factor of 4.0.

Installation Sequence

* See page 12 for an explanation of the load table icons.

Crimp Drive® Anchor

The Crimp anchor is an easy-to-install expansion anchor for use in concrete and grout-filled block. The pre-formed curvature along the shaft creates an expansion mechanism that secures the anchor in place and eliminates the need for a secondary tightening procedure. This speeds up anchor installation and reduces the overall cost.

Five crimp anchor head styles are available to handle different applications that include fastening wood or light-gauge steel, attaching concrete formwork, hanging overhead support for sprinkler pipes or suspended ceiling panels.

Material: Carbon steel

Coating: Zinc plated and mechanically galvanized

Codes: Factory Mutual 3031136 for the 3/8" Rod Coupler.

Head Styles: Mushroom, rod coupler, countersunk, tie-wire and duplex

Installation

Warning: Industry studies show that hardened fasteners can experience performance problems in wet or corrosive environments. Accordingly, with the exception of the duplex anchor, use these products in dry, interior and non-corrosive environments only.

1. Drill a hole using the specified diameter carbide bit into the base material to a depth of at least 1/2" deeper than the required embedment.
2. Blow the hole clean of dust and debris using compressed air. Overhead application need not be blown clean. Where a fixture is used, drive the anchor through the fixture into the hole until the head sits flush against the fixture.
3. Be sure the anchor is driven to the required embedment depth. The rod coupler and tie-wire models should be driven in until the head is seated against the surface of the base material.

Mushroom Head Rod Coupler Countersunk Head Tie-Wire Duplex

CSD/DSD Split-Drive Anchors

The Split-Drive anchor is a one-piece expansion anchor that can be installed in concrete, grout-filled block and stone. As the anchor is driven in, the split-type expansion mechanism on the working end compresses and exerts force against the walls of the hole.

Features

- Available in countersunk (CSD) and duplex-head (DSD) styles
- DSD anchor can be removed with a claw hammer for temporary applications

Material: Carbon steel

Coating: Zinc plated; mechanically galvanized

Installation

-  **Warning (CSD only):** Industry studies show that hardened fasteners can experience performance problems in wet or corrosive environments. Accordingly, use these products in dry, interior and non-corrosive environments only.
-  **Caution:** Oversized holes in the base material will greatly reduce the anchor's load capacity. For CSD, embedment depths greater than 1 1/2" may cause bending during installation.

1. Drill a hole in base material using a 1/4"-diameter carbide-tipped drill. Drill hole to specified embedment depth and blow clean using compressed air. (Overhead installation need not be blown clean.) Alternatively, drill hole deep enough to accommodate embedment depth and dust from drilling. Position fixture and insert split-drive anchor through fixture hole.
2. For CSD, 3/8" diameter fixture hole is recommended for hard fixtures such as steel. For DSD, 5/16"-diameter fixture hole is recommended.
3. Drive anchor until head is flush against fixture.

Sure Wall Drywall Anchor

Sure Wall anchors are self-drilling drywall anchors and provide excellent holding value and greater capacity than screws alone. This anchor cuts threads into drywall, greatly increasing the bearing surface and strength of the fastening.

Features

- Self-drilling — may be installed in gypsum board drywall with only a screwdriver
- Easy to remove and reinstall

Material: Die-cast zinc or reinforced nylon

Sure Wall Product Data — Packaged with Screws

Direct Fastening Solutions

On the jobsite, time is money. That's why Simpson Strong-Tie offers a full range of gas- and powder-actuated tools and fasteners designed to maximize jobsite productivity and operator comfort in most applications.

Single-shot and fully automatic tool options efficiently drive our line of fasteners into concrete and steel. We also offer free online Powder-Actuated Tool certification at www.strongtie.com/pat.

GCN-MEPMAG Gas-Actuated Concrete Nailer

The GCN-MEPMAG and GCN-MEP gas-actuated concrete nailers are portable fastener tools for attaching light-duty fixtures to concrete, steel, concrete block (CMU), lightweight concrete over metal deck, and cold-formed steel. As a magazine tool, GCN-MEPMAG is ideal for attaching drywall track, furring strips, hat track and angle track using GDP and GDPS collated pins.

GCN-MEPMAG offers you the flexibility of having two tools in one convenient package — a magazine tool and a single-shot tool, since the magazine is easily removed without additional assembly tools. As a single-shot tool, the GCN-MEP is great for attaching mechanical, electrical and plumbing fixtures with pre-assembled pins/accessories such as washer pins, ceiling clips, tophats and threaded studs. The pre-assembled pins for the single-shot tool use 0.300"-headed fasteners with 0.125"-diameter shanks for stronger fastening performance.

Both the single-shot and magazine tool offer portability without the need for cords or hoses, and are actuated with GFC34 gas fuel cells.

Features

- Power to drive 0.125"-diameter pins
- Flexibility to drive ½" to 1½" pins
- Flexibility to drive 0.250" and 0.300" dia. headed pins
- Pin-depth adjustment dial
- Battery charge indicator light
- Comfortable "sure-grip" rubber handle and ladder hook
- Easy start-up procedure: Insert fuel cell, insert battery, load pins, and begin use
- FREE tool first-aid repair program (see back cover of operators manual)

Specifications

- Tool dimensions:
 - Length 12.5" (317.5 mm), 17" (432.8 mm)
 - Tool weight: 6.6 lb. (3 kg), 8.3 lb. (3.7 kg) with magazine
 - Height 15.3" (389 mm)
- Compatible fasteners:
 - Length: ½" (12.7 mm) to 1½" (38 mm)
 - Head diameter: 0.250" and 0.300"
 - Shank diameter: 0.106" to 0.125"
- Average number of shots per battery charge: 3,300
- Average number of shots per fuel cell: 1,200
- Average cyclic firing rate: 2 shots per second
- Average battery charge time (6V NiMH): 2 hours
- Operation temperature range: 20°–120°F (–6°–49°C)
- Magazine capacity: 42
- Maximum fastenings before reloading: 40

The magazine is designed to retain two pins during use to prevent the tool from discharging without a fastener (which can damage the tool and possibly cause injury). The tool will resume normal operation when additional pins are loaded.

Minimum Cleaning Required

The GCN-MEP has a very efficient ignition system that provides complete fuel combustion. This results in a cleaner operating tool, which, in turn, results in more tool energy and higher productivity. To maintain maximum level of productivity, periodic cleaning is recommended.

- Only requires cleaning every 20,000 shots
- Easy access to the air filter and piston chamber

The GCN-MEP MAG gas-actuated concrete nailer is ideal for fastening:

- Drywall track
- Lath wire for stucco
- Water-proofing membrane
- Furring strips

Gas-Actuated Concrete Nailing

GDP Pins

GDP concrete pins are designed to work with the GCN-MEPMAG gas-actuated concrete nailer as well as with most major-brand gas-actuated concrete-nailer tools. The patented 10-fastener strip is designed with break-away plastic. The pins are designed for use in A36 and A572 steel, concrete, CMU block and sand-lightweight concrete over metal deck.

Codes: ICC-ES ESR-2811; Florida FL-15730; City of L.A. RR25837

GDPS Pins

The GDPS pins are also designed to work in the GCN-MEPMAG gas-actuated nailer tool for installation into steel and concrete. The step-shank pin, with a smaller-diameter tip, facilitates easier penetration, while the larger-diameter upper shank provides more shear resistance and successful installation.

Gas-Actuated Concrete Nailing

Spiral Knurl Gas Pins

GDPSK gas pins are designed for attaching plywood and OSB to cold-formed-steel studs. The spiral knurl provides a positive lock and resists back-out. Installed with the GCN-MEPMAG, the GDPSK-138 gas pin provides faster installation and setup times, which contributes to lower labor costs. The hardened pins quickly and cleanly pierce the cold-formed steel and leave the pin head flush with the wood fixture. The 1 3/8" length pin can be used for 1/2"-3/4" thick plywood, and 14-22 gauge steel.

GWL-100 Lathing Washer and GMR-2 Magnetic Ring

The GWL-100 lathing washer is used with the GCN-MEPMAG tool and attaches lath to the wall surface for overlaying scratch coats, brown coats and stucco. The washers are held onto the nose of the tool with the new GMR-2 magnetic ring and are attached to the substrate (including concrete and CMU) with GDP pins, which fasten through the washer. No extra tools are needed to install the magnetic ring to the nosepiece of the tool.

Fuel Cell

The GFC34 fuel cell is designed to operate with the GCN-MEPMAG and GCN-MEP, and with many major-brand gas-actuated concrete-nailer tools. The fuel cell provides 1,200 shots and can operate at temperatures between 20° and 120°F (-6°-49°C). The fuel cells are offered individually or in a two-per-pack clamshell. Additionally, one fuel cell is included with each pack of 1,000 pins.

Gas-Actuated Concrete Nailing

GCN-MEP Gas-Actuated Pins and Assemblies for Mechanical, Electrical and Plumbing (MEP) Applications

Pre-assembled MEP fasteners are available for use with the GCN-MEP concrete nailer designed for high-volume applications, such as affixing conduit clips, rod hangers, cable ties and ceiling clips.

With their 0.300" heads, these versatile pins and assemblies can also be used with common powder-actuated tools when fastening into harder substrates (structural steel or extra-hard concrete) when required.

Codes: ICC-ES ESR-2811; Florida FL-15730

Direct Fastening

PTP-27L and PTP-27LMAGR Premium Tools

The PTP-27L and the PTP-27LMAGR are powder-actuated fastening tools designed to provide versatility and ease of use on the jobsite. Both tools deliver productive fastening with automatic piston reset, which enables the user to simply load and shoot. The PTP-27L is a single-shot tool with a longer barrel that can be easily affixed with a fastener magazine. The PTP-27LMAGR is a fully automatic tool with a fastener magazine that can rotate for easier access, or it can be quickly changed to a single-shot tool.

Features

- Adjustable power for fastening versatility: 1–1½ power-level range from a single strip
- Easy disassembly for cleaning and maintenance
- No manual resetting of piston required
- Operator comfort: cushioned grip, reduced recoil and sound-dampening muffler for quiet operation

Key Fastening Applications

- Sill plate installation
- Washered-pin installation (PTP-27L only)
- Insulation fastening (PTP-27L only)
- Forming work
- Cold-formed steel

Specifications

- Fastener Length:
PTP-27L: ½" – 2½" (3" or 4" washered)
PTP-27LMAGR: ⅝" – 2⅞"
- Fastener Type: 0.300" (or 8 mm) diameter headed
- Firing Action:
PTP-27L: Automatic
PTP-27LMAGR: Fully automatic
- **Load Caliber:** 0.27 strip loads, brown through purple (levels 2–6)
- **Length:** 17¾" (PTP-27L), 19½" (PTP-27LMAGR)
- **Weight:** PTP-27L – 6.5 lb., PTP-27LMAGR – 8.8 lb.

Available Kit Combinations

PTP-27L: Single-shot configuration with accessories

PTP-LMAGR: Parts to convert PTP-27L into magazine configuration

PTP-27LMAGR: Magazine configuration with accessories

PTP-LCONKT: Parts to convert PTP-27LMAGR into a single-shot configuration

PTP-27LMAGRKT: Combination kit; includes tool and components for both single-shot and magazine configurations

Adjustable power increases versatility

The full line of Simpson Strong-Tie® powder loads and fasteners begins on page 265

Tool is sold in a rugged tool box complete with

- Operator's manual
- Spall suppressor
- Tools for disassembly
- Safety glasses / ear plugs
- Tool lubricant
- Cleaning brushes
- Operator's exam and caution sign
- Tool box also sold separately
- Gloves

PTP-27L and PTP-27LMAGR Premium Tools

Quick-disconnect baseplate makes it easy to convert the PTP-27LMAGR from a magazine to a single-shot tool.

Complementary Products

Extension pole tool for the PTP-27L and PTP-27LMAGR available in 6' and 8' lengths

Extension Pole Tool (for the PTP-27L) — See page 252 for details.

PTP-27S and PTP-27SMAGR Premium Tools

The PTP-27S and the PTP-27SMAGR are powder-actuated fastening tools designed to provide versatility and ease of use on jobs that require shorter fasteners. Both tools deliver productive fastening with automatic piston reset, which enables the user to simply load and shoot. The PTP-27S is a single-shot tool with a shorter barrel that can be easily affixed with a fastener magazine. The PTP-27SMAGR is a fully automatic tool with rotational fastener magazine that can be quickly changed to a single-shot tool.

Features

- Adjustable power for fastening versatility: 1–1½ power-level range from a single strip
- Operator comfort from cushioned grip, reduced recoil and sound-dampening muffler for quiet operation
- No manual resetting of piston required
- Easy disassembly for cleaning and maintenance

Key Fastening Applications

PTP-27S:

- Conduit clips
- Ceiling clips
- Drywall track
- Metal Decking

PTP-27SMAGR:

- Drywall track
- Hat channel
- HVAC duct straps
- Cold-formed steel
- Furring strips

Specifications

- Fastener Length:
PTP-27S: ½"–1 ⅝"
PTP-27SMAGR: ½"–1 ¼"
- Fastener Type: 0.300" or 8 mm diameter
- Firing Action:
PTP-27S: Automatic
PTP-27SMAGR: Fully automatic
- **Load Caliber:** 0.27 strip loads, brown through purple (levels 2–6)
- **Length:** 16¾" (PTP-27S), 17½" (PTP-27SMAGR)
- **Weight:** PTP-27S – 6.25 lb., PTP-27SMAGR – 8.1 lb.

Adjustable power increases versatility

The full line of Simpson Strong-Tie® powder loads and fasteners begins on page 265.

Available Kit Combinations:

PTP-27S: Single-shot configuration with accessories

PTP-SMAGR: Parts to convert PTP-27S into magazine configuration

PTP-27SMAGR: Magazine configuration with accessories

PTP-SCONKT: Parts to convert PTP-27SMAGR into a single-shot configuration

PTP-27SMAGRKT: Combination kit; includes tool and components for both single-shot and magazine configurations

Tool is sold in a rugged tool box complete with

- Operator's manual
- Spall suppressor
- Tools for disassembly
- Safety glasses / ear plugs
- Tool lubricant
- Cleaning brushes
- Operator's exam and caution sign
- Tool box also sold separately
- Gloves

PTP-27S and PTP-27SMAGR Premium Tools

Rotating magazine allows for installation flexibility.

Quick-disconnect baseplate makes it easy to convert the PTP-27SMAGR from a magazine to a single-shot tool.

Collated pins make for fully automatic fastening and quick loading.

Complementary Products

PT-27HDA Powder-Actuated Heavy-Duty Stud Driver

The PT-27HDA is a low-velocity, heavy-duty powder-actuated tool designed for installing fasteners into poured and precast concrete, grout-filled concrete masonry block and horizontal grouted joints, as well as structural steel. This tool offers easy-cycling, single-shot firing action for continuous use, high reliability and low maintenance. The PT-27HDA features a spall suppressor, which reduces concrete spalling and helps keep the tool perpendicular to the work surface.

Key features

- Heavy-duty stud driver for installing fasteners into steel or hard concrete
- Easy cycling – pulling on the barrel ejects the shell and resets the piston
- Low recoil for greater operator comfort
- Spall suppressor to reduce concrete spalling and keep tool perpendicular to work surface
- Consistent and reliable performance
- Easy disassembly for cleaning and maintenance

Specifications

- Fastener length: 5/8" through 3"
- Fastener types: 1/4" – 20-threaded studs, 3/8" – 16-threaded studs, 8 mm-headed fasteners and 0.300"-headed fasteners with 0.157" shank diameter
- Firing action: Single shot
- Load caliber: 0.27 long single loads, yellow through purple (levels 3–6)
- Length: 14 1/2"
- Weight: 8 lb., 13 oz.

Key Fastening Applications

- 3/8" sprinkler fastenings
- Heavy-duty fastening in concrete strengths up to 8,000 psi
- Structural steel

PT-27HDA is sold in a durable box complete with

- Operator's manual
- Spall suppressor
- 8 mm fastener guide and pistons for use with PDPA, PSLV4 and PHN pins
- 10 mm fastener guide and pistons for use with PSLV3 pins
- Safety glasses / ear plugs
- Tool lubricant
- Cleaning brushes
- Operator's exam and caution sign
- 2 extra stop rings

PT-27HDA

Kit contents for PT-27HDA

Easy cycling: simply pull to eject the shell

Replacement Parts – PT-27HDA

Stop Ring / Buffer	PTHDA-700302

PT-27 General Purpose Tool

The PT-27 is a semi-automatic and fast-cycling fastening tool that is engineered for continuous use, high reliability and low maintenance. This versatile tool fires a variety of fastener types and lengths.

Key Fastening Applications

- Acoustical ceilings
- Electrical applications
- Sill plates
- Drywall track
- Water proofing material and/or lathing

Specifications

- Fastener Length: ½" – 2½" (3" or 4" washered)
- Fastener Type: .300" or 8 mm-headed fasteners or ¼"-20 threaded studs
- Firing Action: Semi-automatic
- Load Caliber: 0.27 strip loads, brown through red (levels 2–5)
- Length: 13½"
- Weight: 5 lb., 4 oz.

Tool is sold in a rugged tool box complete with

- Operator's manual
- Spall suppressor
- Tools for disassembly
- Safety glasses / ear plugs
- Tool lubricant
- Cleaning brushes
- Operator's exam and caution sign

PT-22A General-Purpose Tool

The PT-22A is a powder-actuated tool that uses 0.22 caliber “A” crimp loads, has single-shot firing action and is engineered for continuous use, high reliability and low maintenance.

Key Fastening Applications

- Furring strips
- Framing pins
- Electrical boxes
- Ceiling clips

Specifications

- Fastener Length: ½" – 3" (3" and 4" washered)
- Fastener Type: 0.300" or 8-mm headed fasteners or ¼"-20 threaded studs
- Firing Action: Single shot
- Load Caliber: 0.22 single “A” crimp loads, brown through yellow (levels 2–4). Note: Not for use with 0.22-caliber straight wall loads.
- Length: 13⅞"
- Weight: 4.4 lb.

Tool is sold in a rugged tool box complete with:

- Operator’s manual
- Spall guard
- Tools for disassembly*
- Safety glasses / ear plugs*
- Cleaning brushes*
- Operator’s exam and caution sign*

*These items not supplied with the PT-22A-RB retail package.

PT-22A

The PT-22A is sold individually in a tool box with accessories or in a retail package (see below).

The full line of Simpson Strong-Tie® powder loads and fasteners begins on page 265

PT-22A-RB

PT-22HA General-Purpose Tool

The PT-22HA is a hammer-activated tool engineered for low maintenance and economy. The tool offers three levels of power: Brown through yellow loads (levels 2–4).

Key Fastening Applications

- Remodeling
- Maintenance
- Electricians
- Telecommunications

PT-22HA

Specifications

- Fastener Length: ½"–3" (4" washered)
- Fastener Type: 0.300" or 8 mm-headed fasteners or ¼"-20 threaded studs
- Firing Action: Single shot, hammer activated
- Load Caliber: 0.22 single "A" crimp loads, brown through yellow (levels 2–4). Note: Not for use with 0.22-caliber straight wall loads.
- Length: 14 ¼"
- Weight: 2 lb., 12 oz.

The PT-22HA-RB comes packaged in a retail clamshell ready for merchandising.

Direct Fastening

PT-22P Powder-Actuated Tool

The PT-22P is a single-shot fastening tool engineered for continuous use, high reliability and low maintenance. The all-aluminum body of the PT-22P also provides rugged durability.

Key Fastening Applications

- Drywall track
- Furring strips
- Framing pins
- Electrical boxes
- Ceiling clips

Specifications

- Fastener Length: ½"–1½"
- Fastener Type: 0.300" or 8 mm-headed fasteners or ¼"-20 threaded studs
- Firing Action: Single shot
- Load Caliber: 0.22 single "A" crimp loads, brown through yellow (levels 2-4). Note: Not for use with 0.22-caliber straight wall loads.
- Length: 14"
- Weight: 4 lb. 7 oz.

Tool is sold in a rugged tool box complete with

- Operator's manual
- Spall guard
- Tools for disassembly
- Safety glasses / ear plugs
- Cleaning brushes
- Operator's exam and caution sign
- One additional piston

1. The fasteners must not be driven until the concrete has reached the designated minimum compressive strength.
2. Minimum concrete thickness must be three times the fastener embedment into the concrete.
3. The allowable tension and shear values are only for the fastener in the concrete. Members connected to the concrete must be investigated in accordance with accepted design criteria.

1. The fasteners must not be driven until the concrete has reached the designated minimum compressive strength.
2. Minimum concrete thickness must be three times the fastener embedment into the concrete.
3. The allowable tension and shear values are only for the fastener in the concrete. Members connected to the concrete must be investigated in accordance with accepted design criteria.

* See page 12 for an explanation of the load table icons.

1. The fasteners must not be driven until the concrete has reached the designated minimum compressive strength.
2. Minimum concrete thickness must be three times the fastener embedment into the concrete.
3. The allowable tension and shear values are only for the fastener in the concrete. Members connected to the concrete must be investigated in accordance with accepted design criteria.
4. Minimum concrete edge distance is 1³/₄ inches.
5. Only mechanically galvanized fasteners may be used to attach preservative-treated wood to concrete.
6. Minimum spacing shall be 4" on center.

Spacing of PAT Fasteners for Attachment of Wood Sill Plates to Normal-Weight Concrete

Direct Fastening Type	Model No.	Overall Length In. (mm)	Nominal Head Diameter In. (mm)	Shank Diameter In. (mm)	Maximum Spacing In. (mm)
					Interior Nonstructural Walls ²
Powder Actuated	PHNW-72 ³	2 ⁷ / ₈ (73)	0.315 (8.0)	0.145 (3.7)	36 (914)
	PDPAW-287 ⁴ PDPAWL-287 ⁴ PDPAWL-287MG ⁴	2 ⁷ / ₈ (73)	0.300 (7.6)	0.157 (4.0)	48 (1219)

1. Spacings are based upon the attachment of 2-inch (nominal thickness) wood sill plates, with specific gravity of 0.50 or greater, to concrete floor slabs or footings.
2. All walls shall have fasteners placed at 6 inches from ends of sill plates, with maximum spacing as shown in the table.
3. Fasteners shall not be driven until the concrete has reached a compressive strength of 2,000 psi. Minimum edge distance is 1³/₄ inches.
4. Fasteners shall not be driven until the concrete has reached a compressive strength of 2,500 psi. Minimum edge distance is 1³/₄ inches.
5. The maximum horizontal transverse load on the wall shall be 5 psf.
6. The maximum wall height shall be 14 feet.
7. For exterior walls and interior structural walls, this table is not applicable and allowable loads must be used.
8. Walls shall be laterally supported at the top and the bottom.
9. Minimum spacing shall be 4" on center.
10. Only mechanically galvanized fasteners may be used to attach preservative-treated wood to concrete.

* See page 12 for an explanation of the load table icons.

- The entire pointed portion of the fastener must penetrate through the steel to obtain the tabulated values, unless otherwise indicated.
- The allowable tension values are for the fastener only. Members connected to the steel must be investigated separately in accordance with accepted design criteria.
- Steel strength must comply with the minimum requirements of ASTM A 36 ($F_y = 36$ ksi, $F_u = 58$ ksi), ASTM A 572, Grade 50 ($F_y = 50$ ksi, $F_u = 65$ ksi), or ASTM A992 ($F_y = 50$ ksi, $F_u = 65$ ksi).
- Based upon minimum penetration depth of 0.46" (11.7 mm).

- Based upon minimum penetration depth of 0.58" (14.7 mm).
- Based upon minimum penetration depth of 0.36" (9.1 mm).
- The fastener must be driven to where the point of the fastener penetrates through the steel.
- Based upon minimum penetration depth of 0.35" (8.9 mm).
- Based upon minimum penetration depth of 0.25" (6.4 mm).
- For stepped shank fasteners: (Diameter of shank above the step)/(Diameter of shank below the step.)
- PHN-16K or longer.

* See page 12 for an explanation of the load table icons.

3. Fastener is to be installed in the center of the stud flange.

Typical GDPSK Installation

Direct Fastening

PHN Fasteners Attaching Light-Gauge Steel Channels — Allowable Shear Loads in Normal-Weight Concrete    *

Model No.	Shank Diameter in. (mm)	Minimum Penetration in. (mm)	Light Gauge Steel Channel Thickness gauge	Allowable Shear Load lb. (kN)
				$f'_c \geq 2,000$ psi (13.8 MPa) Concrete
PHN	0.145 (3.7)	7/8 (22)	20	160 (0.71)
			18	135 (0.60)

1. The fasteners shall not be driven until the concrete has reached the designated compressive strength. Minimum concrete thickness is three times the faster embedment into the concrete.

* See page 12 for an explanation of the load table icons.

Restoration Solutions

Simpson Strong-Tie offers a line of products designed for structural and architectural rehabilitation of concrete and masonry.

Our restoration solutions provide reliable, easy-to-use products for a variety of applications, including structural restoration, pick-proof sealing and water-intrusion prevention.

ETI Injection Epoxy

ETI injection epoxies are two-component, high-solids formulations for the injection into cracks in concrete. Dispensed through a static mixing nozzle using either a manual, battery-powered or a pneumatic dispensing tool, these epoxies provide a waterproof, high strength (structural) repair.

Features

- Bonds chemically to concrete, providing structural repair (meets the requirements of ASTM C 881 for structural repair epoxy)
- Formulated for maximum penetration under pressure (all viscosities)
- Seals out moisture, protecting rebar in the concrete from corrosion and flooring from moisture damage
- Reliable mixing and ratio control when used with the Simpson Strong-Tie® Optimix® static mixing nozzle (included with cartridge)
- Suitable for pressure injection or gravity-feed applications
- Non-shrink material resists oils, salts and mild chemicals
- Final product color: ETI-SLV – dark purple / black; ETI-LV – amber; ETI-GV – gray

ETI-SLV

ETI-SLV Super-Low-Viscosity Epoxy

- Super-low viscosity (350 cP) repairs hairline cracks (0.002") and cracks up to ¼" in width
- Penetrates smallest cracks
- Meets or exceeds AASHTO M-235 and ASTM C881 Type I and IV, Grade 1, Class B and C

ETI-LV Low-Viscosity Epoxy

- Repairs fine to medium cracks ¼" to ¼" in width
- Offers low surface tension to effectively penetrate narrow cracks
- Approved under NSF/ANSI standard 61
- Meets or exceeds AASHTO M-235 and ASTM C881 Type I and IV, Grade 1, Class C

ETI-GV Gel-Viscosity Epoxy

- Gel-viscosity (non-sag) epoxy repairs medium cracks ¾" – ¼" in width
- Decreases in viscosity under pressure, increasing flow
- Suitable for use as pick-proof sealant around doors, windows and fixtures
- Meets or exceeds AASHTO M-235 and ASTM C881 Type I and IV, Grade 3, Class C

Application Considerations

- Suitable for repairing non-moving cracks in concrete walls, floors, slabs, columns and beams.
- ETI can be used to inject cracks in damp or wet conditions (non-seeping or non-leaking conditions only) with excellent results.
- Apply to concrete 60°F or above. For best results, warm material to 60°F or above prior to application.
- Mixed material in nozzle and injection fitting hardens in 15 minutes (ETI-SLV), and in 60 minutes (ET-LV, ETI-GV) at temperatures of 40°F or above

Shelf Life: 24 months from date of manufacture in unopened cartridge

Storage Conditions: For best results, store between 45°F and 95°F

Injection Instructions: See pages 293–297.

ETI Cartridge System¹

Model No.	Capacity ounces (cubic in.)	Dispensing Tool	Mixing Nozzle
ETISLV	16.5 (29.8)	EDT22S	EMN022 (included)
ETILV22	22 (39.7)		
ETIGV22			

1. Bulk containers also available. Contact Simpson Strong-Tie for details.
2. Use only appropriate Simpson Strong-Tie® mixing nozzles in accordance with Simpson Strong-Tie instructions. Modification or improper use of mixing nozzle may impair epoxy performance.
3. EDT22s tool must be configured for 2:1 cartridge ratio.

Crack-Pac® Injection Epoxy

The Crack-Pac® injection epoxy is designed to repair cracks in concrete ranging from 1/64" to 1/4" wide in concrete walls, floors, slabs, columns and beams. The mixed adhesive has the viscosity of a light oil and a low surface tension, allowing it to penetrate fine to medium-width cracks in dry, damp or wet conditions with excellent results. Resin is contained in the cartridge and hardener is contained in the nozzle.

Features

- Dispenses with a standard caulking tool, no special dispensing tool needed
- Clean and easy to mix
- Seals out moisture, protecting rebar in the concrete from corrosion and flooring from moisture damage
- Chemically bonds with the concrete to restore strength
- Non-shrink material resistant to oils, salts and mild chemicals
- Meets the requirements of AASHTO M-235 and ASTM C881, Type IV, Grade 1, Class C

Application Considerations

- Suitable for repair of cracks ranging from 1/64" to 1/4" wide in concrete walls, floors, slabs, columns and beams
- Can be used to inject cracks in dry, damp or wet conditions with excellent results. Not for use in actively leaking cracks.
- In order for components to mix properly, the resin and hardener must be conditioned to 60°F–80°F before mixing

Shelf Life: 24 months from date of manufacture, unopened

Storage Conditions: For best results, store between 45°F and 95°F

Injection Instructions: See pages 293–297.

Complementary Products

Crack-Pac® injection epoxy is also available in the Crack-Pac Injection Kit. (ETIPAC10KT). The kit includes everything needed to pressure inject approximately 8 lineal feet of cracks (assumes a concrete thickness of 4" and 1/16" crack width).

- 2 Crack-Pac cartridge/nozzle sets
- 12 E-Z-Click injection ports
- 2 E-Z-Click injection fittings with 12" tubing
- 1 pint of ETR paste-over epoxy (8 oz. of resin + 8 oz. of hardener)
- 4 disposable wood paste-over applicators
- 1 pair latex gloves
- Installation video

CPFH09KT	18 (32.4)	single	2 (kits)	

Crack-Pac® Flex-H₂O™ Polyurethane Crack Sealer

The Crack-Pac® Flex-H₂O™ polyurethane injection resin seals leaking cracks, voids or fractures from 1/32" to 1/4" wide in concrete or solid masonry. Designed to perform in applications where water is seeping or mildly leaking from the crack, the polyurethane is packaged in the cartridge and an accelerator is packaged in the nozzle. When the resin encounters water as it is injected into the crack, it becomes an expanding foam that provides a flexible seal in leaking and non-leaking cracks.

Features

- Can be dispensed with a standard caulking tool
- Can also be used on dry cracks if water is introduced to affected area
- Can be used with a reduced amount or without accelerator to slow down reaction time
- Expands to fill voids and seal the affected area
- Fast reacting – reaction begins within 1 minute after exposure to moisture; expansion may be completed within 3 minutes (depending on the amount of moisture and the ambient temperature)
- 20:1 expansion ratio (unrestricted rise) means less material needed

Application Considerations

- Suitable for sealing cracks ranging from 1/32" to 1/4" wide in concrete and solid masonry.
- Suitable for repair of cracks in dry, damp and wet conditions with excellent results. Designed to perform in applications where water is seeping or mildly leaking from the crack.
- In order for components to mix properly, the resin and hardener must be conditioned to 60°F–90°F before mixing.

Shelf Life: 12 months from the date of manufacture, unopened

Usage Temperature: 60°F to 90°F

Storage Conditions: For best results, store in a dry area between 45°F and 90°F. Product is very moisture sensitive.

Installation Instructions: See pages 293–297.

Accessories: See page 289 for information on mixing nozzles and for crack repair accessories.

Additional Components Needed for Crack Repair

1. Use only an appropriate Simpson Strong-Tie® mixing nozzle in accordance with Simpson Strong-Tie instructions. Modification or improper use of mixing nozzle may impair epoxy performance.
2. EIPX intended for use as a surface mount port in corners and a drilled-in port on flat surfaces. All accessories compatible with ETI-SLV, ETI-LV and ETI-GV epoxies.

Detailed information on the full line of Simpson Strong-Tie® manual and pneumatic dispensing tools is available on pages 128–129.

Heli-Tie™ Helical Wall Tie

The Heli-Tie™ is a stainless-steel helical tie used to anchor building façades to structural members or to stabilize multiple-wythe brick walls.

The helical design allows the tie to be driven quickly and easily into a predrilled pilot hole (or embedded into mortar joints in new construction) to provide a mechanical connection between a masonry façade and its backup material or between multiple wythes of brick. As it is driven, the fins of the tie undercut the masonry to provide an expansion-free anchorage that will withstand tension and compression loads.

The Heli-Tie wall tie is installed using a proprietary setting tool that is used with an SDS-PLUS shank rotohammer to drive and countersink the tie. Heli-Tie wall ties perform in concrete and masonry as well as wood and steel studs.

Heli-Tie™ Helical Wall Tie

U.S. Patent 7,269,987

Features

- Installs quickly and easily — with the rotohammer in hammer mode, the tie installs faster than competitive products.
- Provides an inconspicuous repair that preserves the appearance of the building. After installation, the tie is countersunk up to ½" below the surface, allowing the tie location to be patched.
- Larger core diameter provides higher torsional capacity, resulting in less deflection due to “uncoiling” under load.
- Fractionally sized anchor — no metric drill bits required.
- Patented manufacturing process results in a more uniform helix along the entire tie, allowing easier driving and better interlock with the substrate.

Material: Type-304 stainless steel (Type 316 available by special order—contact Simpson Strong-Tie for details)

Test Criteria: CSA A370

Installation

- Drill pilot hole through the façade material and into the backup material to the specified embedment depth + 1" using appropriate drill bit(s). Drill should be in rotation-only mode when drilling into soft masonry or into hollow backing material.
- Position blue end of the Heli-Tie™ fastener in the installation tool and insert the tie into the pilot hole.
- With the SDS-PLUS rotohammer in hammer mode, drive the tie until the tip of the installation tool enters the exterior surface of the masonry and countersinks the tie below the surface. Patch the hole in the façade.

Installation Sequence

Special-order lengths are also available; contact Simpson Strong-Tie for details.

Caution: Loads are guide values based on laboratory testing. On-site testing shall be performed for verification of capacity since base material quality can vary widely.

1. Tabulated loads are guide values based on laboratory testing. Onsite testing shall be performed for verification of capacity since base material quality can vary widely.
2. Ultimate load is average load at failure of the base material. Heli-Tie™ fastener average ultimate steel strength is 3,885 pounds and does not govern.
3. Load at maximum permitted displacement is average load at displacement of 0.157 inches (4 mm). The designer shall apply a suitable factor of safety to these numbers to derive allowable service loads.
4. Solid brick values for nominal 4-inch-wide solid brick conforming to ASTM C62/C216, Grade SW, Type N mortar is prepared in accordance with IBC Section 2103.8.
5. Hollow brick values for nominal 4-inch-wide hollow brick conforming to ASTM C216/C652, Grade SW, Type HBS, Class H40V. Mortar is prepared in accordance with IBC Section 2103.8.
6. Grout-filled CMU values for 8-inch-wide lightweight, medium-weight and normal-weight concrete masonry units. The masonry units must be fully grouted. Values for 8-inch-wide concrete masonry units (CMU) with a minimum specified compressive strength of masonry, f'_m , at 28 days is 1,500 psi.
7. Hollow CMU values for 8-inch-wide lightweight, medium-weight and normal-weight concrete masonry units.
8. Normal-weight concrete values for concrete with minimum specified compressive strength of 2,500 psi.
9. 2x4 wood stud values for nominal 2x4 Spruce-Pine-Fir.
10. Metal stud values for 20-gauge C-shape metal stud.
11. For new construction. Anchor one end of tie into backup material. Embed other end into veneer mortar joint. Not for retrofits due to difficulty of locating center of 2x4 or metal stud flange.

Compression (Buckling) Loads¹

Size in. (mm)	Unsupported Length in. (mm)	Ultimate Compression Load ¹ lb. (kN)
3/8 (9.0)	1 (25)	1,905 (8.5)
	2 (50)	1,310 (5.8)
	4 (100)	980 (4.4)
	6 (150)	785 (3.5)

1. The Designer shall apply a suitable factor of safety to these numbers to derive allowable service loads.

HELITEST37A

HELIKEY37A

Heli-Tie™ Wall Tie Tension Tester - Model HELITEST37A

Recommended equipment for onsite testing to accurately determine load values in any specific structure, the Heli-Tie wall tie tension tester features a key specifically designed to grip the Heli-Tie fastener and provide accurate results. Replacement test keys sold separately (Model HELIKEY37A).

Heli-Tie™ Helical Stitching Tie

The Simpson Strong-Tie® Heli-Tie™ helical stitching tie provides a unique solution to the preservation and repair of damaged brick and masonry structures. Ties are grouted into existing masonry to repair cracks and increase strength with minimum disturbance. Made of Type-304 stainless steel, the Heli-Tie stitching tie features radial fins formed on the steel wire via cold rolling process, increasing the tensile strength of the tie.

HELIST254000

Features

- Helical design distributes loads uniformly over a large surface area
- Installs into the mortar joint to provide an inconspicuous repair and preserve the appearance of the structure
- Type-304 stainless steel offers superior corrosion resistance to original reinforcement
- Patented manufacturing process results in consistent, uniform helix configuration (U.S. Patent 7,269,987)
- Batch number printed on each tie for easy identification and inspection

HELIST254000: ¼" x 40" stitching tie

Material: Type-304 stainless steel

Ordering Information: Sold in tubes of 10

Installation Instructions

- Chase bed joint 20" on either side of the affected area to a depth of approximately 1 ¼" with a rotary grinding wheel. Vertical spacing of installation sites should be 12" for red brick or "every other course" for concrete masonry units.
- Clear bed joint of all loose debris.
- Mix non-shrink repair grout or mortar per product instructions and place into the prepared bed joint, filling the void to approximately two-thirds of its depth. Simpson Strong-Tie FX-263 repair mortar may be used.
- Embed the tie at one-half the depth of the void. Trowel displaced grout to fully encapsulate the tie.
- Fill any remaining void and vertical cracks with non-shrink repair grout or other repair mortar to conceal repair site.

Installation Sequence

Crack Injection Guide

Important: These instructions are intended as recommended guidelines. Due to the variability of field conditions, selection of the proper material for the intended application and installation is the sole responsibility of the applicator.

Epoxy injection is an economical method of repairing non-moving cracks in concrete walls, slabs, columns and piers and is capable of restoring the concrete to its pre-cracked strength. Prior to doing any injection it is necessary to determine the cause of the crack. If the source of cracking has not been determined and remedied, the concrete may crack again.

Materials

- ETI-SLV for repair of hairline cracks (0.002") and those up to 1/4" in width.
- ETI-LV for repair of fine to medium-width cracks (Suggested width range: 1/64"–1/4").
- ETI-GV for repair of medium-width cracks (Suggested width range: 3/32"–1/4")
- Crack-Pac® injection epoxy for repair of fine to medium non-structural cracks (Suggested width range: 1/64"–1/4")
- CIP-F and ETR are recommended for paste-over of crack surface and installation of injection ports. ET-HP, EDOT™, ETR or SET adhesives may also be used as a substitute. (SET is the only paste-over epoxy approved for NSF/ANSI Standard 61.)
- E-Z-Click™ injection ports, fittings and other suitable accessories.

Estimating Guide for Epoxy Crack Injection

Width of Crack (in.)	Concrete Thickness (in.)	Approx. Coverage per 22 oz. Cartridge (linear ft.)	Approx. Coverage per 16.5 oz. Cartridge (linear ft.)	Approx. Coverage per 9 oz. Cartridge (linear ft.)

	8	1.5	1.1	0.6
	10	1.2	0.9	0.5

Coverage listed is approximate and will vary depending on waste and condition of concrete.

Crack Injection Guide

Preparation of the Crack for Injection

Clean the crack and the surface surrounding it to allow the paste-over to bond to sound concrete. At a minimum, the surface to receive paste-over should be brushed with a wire brush. Oil, grease or other surface contaminant must be removed in order to allow the paste-over to bond properly. Take care not to impact any debris into the crack during cleaning. Using clean, oil-free compressed air, blow out the crack to remove any dust, debris or standing water. Best results will be obtained if the crack is dry at the time of injection. If water is continually seeping from the crack, the flow must be stopped in order for epoxy injection to yield a suitable repair. Other materials such as polyurethane resins may be required to repair an actively leaking crack.

For many applications, additional preparation is necessary in order to seal the crack. Where a surfacing material has been

removed using an acid or chemical solvent, prepare the crack as follows:

1. Using clean, compressed air, blow out any remaining debris and liquid.
2. Remove residue by high-pressure washing or steam cleaning.
3. Blow any remaining water from the crack with clean compressed air.

If a coating, sealant or paint has been applied to the concrete, it must be removed before placing the paste-over epoxy. Under the pressure of injection, these materials may lift and cause a leak. If the surface coating is covering the crack, it may be necessary to route out the opening of the crack in a "V" shape using a grinder in order to get past the surface contamination.

Sealing of the Crack and Attachment of E-Z-Click™ Injection Ports

1. To adhere the port to the concrete, apply a small amount of paste-over around the bottom of the port base (Picture 1). Place the port at one end of the crack and repeat until the entire crack is ported (Picture 2). As a rule of thumb, injection ports should be placed 8" apart along the length of the crack.

Important: Do not allow paste-over to block the port or the crack under it; this is where the injection epoxy must enter the crack.

2. Using a putty knife or other paste-over tool, generously work paste-over along the entire length of the crack (Picture 3). Take care to mound the paste-over around the base of the port to approximately ¼" thick extending 1" out from the base of the port and to work out any holes in the material. It is recommended that the paste-over should be a minimum of ⅜" thick and 1" wide along the crack. Insufficient paste-over will result in leaks under the pressure of injection. If the crack passes completely through the concrete element, seal the back of the crack, if possible. If not, epoxy may be able to run out the back side of the crack, resulting in an ineffective repair.
3. Allow the paste-over to harden before beginning injection. Note: CIP-F and ETR epoxies are fast-cure materials and may harden prematurely if left in a mixed mass on the mixing surface while installing ports. Spreading paste-over into a thin film (approximately ⅛") on the mixing surface will slow curing by allowing the heat from the reaction to dissipate.

Injection Procedure for ETI-SLV, ETI-LV, ETI-GV and Crack-Pac® Injection Epoxy

1. Follow cartridge preparation instructions on the cartridge label. Verify that the material flowing from the Optimix® mixing nozzle is a uniform and consistent color: for ETI-SLV, the mixed product is black; ETI-LV is transparent amber; and ETI-GV is grey. For Crack-Pac® injection epoxy, verify that the mixed material in the cartridge is a transparent amber color.
2. Attach the E-Z-Click™ fitting to the end of the nozzle by pushing the tubing over the barbs at the end of the nozzle. Make sure that all ports are pushed in to the open position.
3. Attach the E-Z-Click™ injection fitting to the first E-Z-Click™ port until it clicks into place. Make sure that the heads of all the ports are pushed in to the open position. In vertical applications, begin injection at the lowest port and work your way up. In a horizontal application, start at one end of the crack and work your way to the other end.
4. Inject epoxy into the first port until it will no longer flow into the crack. If epoxy shows at the next port and the first port still accepts material, close the second port and continue to inject into the first port until it accepts no more epoxy. Continue closing ports where epoxy appears until the first port refuses epoxy. When the first port reaches the point of refusal, brace the base of the port and pull out gently on the head of the port to close it. Pulling too hard may dislodge the port from the surface of the concrete, causing a leak. Depress the metal tab on the head of the E-Z-Click fitting and remove it from the port.
5. Go to the last port where epoxy appeared while injecting the first port, open it, and continue injection at this port. If the epoxy has set up and the port is bonded closed, move to the next clean port and repeat the process until every portion of the crack has refused epoxy.

While this method may appear to leave some ports uninjected, it provides maximum pressure to force the epoxy into the smaller areas of the crack. Moving to the next port as soon as epoxy appears will allow the epoxy to travel along the wider parts of the crack to the next ports rather than force it into the crack before it travels to the next ports.

Crack Injection Guide

INJECTION TIPS

- If using a pneumatic dispensing tool, set the tool at a low setting when beginning injection and increase pressure if necessary to get the epoxy to flow.
- For narrow cracks, it may be necessary to increase the pressure gradually until the epoxy begins to flow. It may also be necessary to wait for a few minutes for the epoxy to fill the crack and travel to the next port.
- If desired, once the injection epoxy has cured, remove the injection ports and paste-over. An epoxy-based paste-over can be removed with a chisel, scraper or grinder. The paste-over can

be simply peeled off if CIP-F is used. Using a heat gun to soften the epoxy is recommended when using a chisel or scraper.

- Mixing nozzles can be used for multiple cartridges as long as the epoxy does not harden in the nozzle. For injection epoxies in side-by-side cartridges, care must be taken to ensure the level of material is the same on both parts of the cartridge. This can be done by checking for air in the cartridge and the positions of the wipers in the back of the cartridge. If the liquid levels are off by more than 1/8", then Step 1 from the injection procedures must be repeated.

TROUBLESHOOTING

Epoxy is flowing into the crack, but not showing up at the next port.

This can indicate that the crack either expands and/or branches off under the surface of the concrete. Continue to inject and fill these voids. In situations where the crack penetrates completely through the concrete element, and the back-side of the concrete element cannot be sealed (e.g., basement walls, or footings with backfill), longer injection time may not force the epoxy to the next port. This most likely indicates that epoxy is running out the unsealed back side of the crack. In this case, the application may require a gel viscosity injection epoxy (ETI-GV) or may not be suitable for epoxy injection repair without excavation and sealing of the back side of the crack.

Epoxy is leaking from the pasted-over crack or around injection ports.

Stop injecting. If using a fast-cure paste-over material (ETR or CIP), wipe off the leaking injection epoxy with a cotton cloth and reapply the paste-over material. Wait approximately 10–15 minutes to allow the epoxy to begin to harden. If the leak is large (e.g., the port broke off of the concrete surface), it is a good idea to wait approximately 30 minutes, or longer as necessary, to allow the paste-over to cure more completely. Check to see that the epoxy is hard before reinjecting, or the paste-over or ports may leak. Another option for small leaks is to clean off the injection epoxy and use paraffin or crayon to seal the holes.

More epoxy is being used than estimated.

This may indicate that the crack either expands or branches off below the surface. Continue to inject and fill these voids. This

may also indicate that epoxy is running out the back side of the crack. If the crack penetrates completely through the concrete element and cannot be sealed, the application may require a gel viscosity injection epoxy (ETI-GV) or may not be suitable for injection repair.

Back pressure is preventing epoxy from flowing. This can indicate several situations:

- The crack is not continuous, and the portion being injected is full. (See above instructions about injection after the port has reached refusal.)
- The port is not aligned over the crack properly.
- The crack is blocked by debris.
- The injection epoxy used has too high a viscosity.
- If the mixing nozzle has been allowed to sit for a few minutes full of epoxy, the material may have hardened in the nozzle. Attach the E-Z-Click™ fitting to a port at another uninjected location on the crack and attempt to inject. If the epoxy still won't flow, chances are the epoxy has hardened in the nozzle. If so, replace the nozzle.

Less epoxy is being used than estimated.

This may indicate that the crack is shallower than originally thought, or the epoxy is not penetrating the crack sufficiently before moving to the next port. Reinject some ports with a lower-viscosity epoxy to see if the crack will take more epoxy. Another option is to heat the epoxy to a temperature of 80–100°F, which will reduce its viscosity and allow it to penetrate into small cracks easier. The epoxy should be heated uniformly; do not overheat cartridge.

Crack Injection Guide

Injection Procedure for Crack-Pac® Flex-H₂O™ Crack Sealer

1. Follow cartridge preparation instructions on the cartridge label. Verify that the material flowing from the nozzle is a uniform green color.
2. Attach the E-Z-Click™ fitting to the end of the nozzle by pushing the tubing over the barbs at the end of the nozzle. Make sure that all ports are pushed into the open position.
3. Attach the E-Z-Click injection fitting to the first E-Z-Click port until it clicks into place. Make sure that the head of the port is pushed into the open position. In vertical applications, begin injection at the lowest port and work your way up. In a horizontal application, start at one end of the crack and work your way to the other end.
4. Inject polyurethane into the first port until material shows at the next port. Remove the E-Z-Click fitting by bracing the base of the port and pulling out gently on the head of the port to close it. Pulling too hard may dislodge the port from the surface of the concrete, causing a leak. Depress the metal tab on the head of the E-Z-Click fitting and remove it from the port.
5. Move to the next port and repeat until all ports have been injected.

Injection Tips for Crack-Pac® Flex-H₂O Crack Sealer

- For narrow cracks, it may be necessary to increase the pressure gradually until the polyurethane begins to flow. It may also be necessary to wait a few minutes for the material to fill the crack and travel to the next port.
- If desired, once the polyurethane has cured, remove the injection ports and paste-over epoxy or hydraulic cement. The paste-over can be removed with a chisel, scraper or grinder.

Troubleshooting for Crack-Pac® Flex-H₂O Crack Sealer

Polyurethane is flowing into the crack, but not showing up at the next port.

This can indicate that either the crack expands and/or branches off under the surface of the concrete. Continue to inject and fill these voids.

Back pressure is preventing polyurethane from flowing.

This can indicate several situations:

- The crack is not continuous and the portion being injected is full.
- The port is not aligned over the crack properly.
- The crack is blocked by debris.

Polyurethane is leaking from the pasted-over crack or around injection ports.

Stop injecting. If using a fast cure paste-over material (ETR or CIP), wipe off the leaking injection epoxy with a cotton cloth and reapply the paste over material. Wait a approximately 10–15

minutes to allow the paste-over to begin to harden. If the leak is large (e.g., the port broke off of the concrete surface), it is a good idea to wait approximately 30 minutes, or longer as necessary, to allow the paste-over to cure more completely. Check to see that the paste-over is hard before reinjecting or the paste-over or ports may leak.

Another option for small leaks is to clean off the injection adhesive and use paraffin or crayon to seal the holes.

More polyurethane is being used than estimated.

This may indicate that the crack either expands or branches off below the surface. Continue to inject and fill these voids.

Less polyurethane is being used than estimated.

This may indicate that the crack is shallower than originally thought, or the polyurethane is not penetrating the crack sufficiently before moving to the next port.

Crack Injection Guide

GRAVITY-FEED PROCEDURE

In some horizontal applications where complete penetration isn't a requirement, cracks can be repaired using the gravity-feed method.

1. Follow cartridge preparation instructions on the cartridge label. Verify that the material flowing from the Optimix® mixing nozzle is a uniform and consistent color: For ETI-SLV, the mixed product is black, while ETI-LV is transparent amber. For Crack-Pac® injection epoxy, verify that the mixed material in the cartridge is a transparent amber color.
2. Starting at one end of the crack, slowly dispense epoxy into the crack, moving along the crack as it fills. It will probably be necessary to do multiple passes in order to fill the crack. It is possible that the epoxy will take some time to run into the crack, and the crack may appear empty several hours after the initial application. Reapply epoxy until the crack is filled.
3. In situations where the crack completely penetrates the member (e.g., concrete slab), the material may continue to run through the crack into the subgrade. It may be possible to use a small amount of coarse, dry sand to act as a barrier for the injection epoxy. Place the sand in the crack to a level no more than ¼" thickness of the member and apply the injection epoxy as described in step 2. The epoxy level will drop as it penetrates the sand, but should cure and provide a seal to the bottom of the crack. Reapply the epoxy until the crack is filled. In some cases, application of sand is impractical or not permitted and epoxy repair may not provide a complete and effective repair. Use of a gel viscosity injection epoxy (ETI-GV) may permit a surface repair to the crack with partial penetration.

Carbide Drill Bits

Simpson Strong-Tie offers a complete line of premium-quality drill bits, core bits and chisels to handle any drilling demolition and concrete preparation need. Our carbide products are manufactured to demanding tolerances and are designed to maximize production on the jobsite.

Our carbide-tipped drill bits are premium-quality, professional-grade tools manufactured in Germany to the highest industry standards. They are designed to meet precise ANSI tolerance requirements and incorporate proprietary features that enhance durability, drilling speed and usability. Regular and quad-head bit and solid-tipped tip configurations are available. Shank styles include SDS-PLUS, SDS-Max, Spline, and Straight.

Carbide Drill Bits for Concrete and Masonry

Carbide Drill Bit Selection Information

Our carbide-tipped drill bits are premium-quality, professional-grade tools manufactured in Germany to the highest industry standards for Simpson Strong-Tie.

They are designed to meet precise ANSI tolerance requirements and incorporate proprietary features that enhance durability and drilling speed, while improving ease of use. Regular and quad-head bit tip and solid-tipped configurations are available. Shank styles include SDS-PLUS, SDS-MAX, spline and straight.

Features and Benefits

- Uniformly brazed carbide inserts result in longer bit life
- Most bits contain a centering tip that facilitates easy spot drilling
- Chromium-nickel-molybdenum steel alloy body ensures hammering quality and extended service life
- Heat-treatment procedures and shot-peened finish increase surface hardness and drilling speed, reduce drill bit wear and improve resistance to bending forces
- Drill bits conform to ANSI Standard B212.15

Additional Features for SDS-MAX, Spline and Select SDS-PLUS Bits:

- Chisel-shaped drill bit head penetrates the material and directs concrete dust into the multi-flute spiral
- Patented, high-volume, multi-flute spiral quickly channels concrete dust from the hole to improve drilling speed
- 4 x 90° head geometry crushes through rebar and prevents sticking in reinforced concrete

Solid-tip carbide drill bit

Quad-Head Feature

(Available in SDS-PLUS, SDS-MAX and spline shank)

All the features of single cutter bits and the quad-head dual-cutter are designed to improve durability and drilling speed. The high-volume, double-helix design of the quad-head bit comes with the patented, high-performance, reinforced core flute to maximize energy transfer.

Simpson Strong-Tie® drill bits come in various shank styles to fit virtually any drill or rotohammer.

SDS-MAX SDS-PLUS Spline Straight 'A' Taper

Carbide Drill Bits for Concrete and Masonry

Drill Bit Tool Selection Guide

SDS-PLUS

Fits all current and older SDS-PLUS rotohammers from AEG, Black & Decker, Bosch, DeWalt, Hitachi, Hilti, Kango, Makita, Metabo, Milwaukee, Porter Cable, Ramset, Red Head, Ryobi, Skil

SDS-MAX

Fits all current and older SDS-MAX rotohammers from Black & Decker, Bosch, DeWalt, Hitachi, Hilti, Kango, Makita, Metabo, Milwaukee

Spline

Fits all current and older Spline rotohammers from AEG, Black & Decker, Bosch, DeWalt, Hitachi, Kango, Makita, Metabo, Milwaukee, Ramset, Red Head, Ryobi

Rebar Cutters/Adaptors

Rebar Cutters**

When hole placement conflicts with rebar or wire mesh, these bits enable the rebar to be removed so the hole can be drilled to the proper depth. Rebar cutters are separate from shanks. Shanks work with all sizes of rebar cutters. Overall length is approximately 15".

** After drilling through the reinforcement or plate, remove debris from the hole and resume drilling with carbide tipped drill bit.

Rebar Cutter Detail

Rebar Cutter

Plate Cutters**

Similar to rebar cutters, these bits are designed for cutting through steel base plates when it is necessary to enlarge the fixture hole. These bits can also be used as rebar cutters. Plate cutters are separate from shanks. Shanks work with all sizes of plate cutters.

** After drilling through the reinforcement or plate, remove debris from the hole and resume drilling with carbide-tipped drill bit.

Demolition Chisels and Bits

Simpson Strong-Tie® chisels are made of toughened steel with special surface treatment that improves performance. The superior tempering process creates a hardened surface that is more wear resistant and allows the working point to be re-sharpened, which extends the life of the tool.

Simpson Strong-Tie® demolition chisels and bits come in various shank styles to fit virtually any demolition tool.

Appendix – Supplemental Topics

To keep you as informed as possible, the following topics are included in this Appendix:

Supplemental Topics for Anchors	Page
I. Base Materials	316
II. Anchor Failure Modes	316
III. Corrosion Resistance	316
IV. Mechanical Anchors	318
V. Adhesive Anchors	318
Allowable Stress Design (ASD) Method	322
Strength Design (SD) Method	322
AC308 Modifications to ACI 318	323
Example Calculations	324

Supplemental Topics for Anchors

I. Base Materials

“Base material” is a generic industry term that refers to the element or substrate to be anchored to. Base materials include concrete, brick, concrete block (CMU) and structural tile, to name a few. The most common type of base material where adhesive and mechanical anchors are used is concrete.

Concrete – Concrete can be cast-in-place or precast concrete. Concrete has excellent compressive strength, but relatively low tensile strength. Cast-in-place (or sometimes called “poured in place”) concrete is placed in forms erected on the building site. Cast-in-place concrete can be either normal-weight or lightweight concrete. Lightweight concrete is often specified when it is desirable to reduce the weight of the building structure.

Lightweight concrete differs from normal-weight concrete by the weight of aggregate used in the mixture. Normal-weight concrete has a unit weight of approximately 150 pounds per cubic foot compared to approximately 115 pounds per cubic foot for lightweight concrete.

The type of aggregate used in concrete can affect the tension capacity of an adhesive anchor. Presently, the relationship between aggregate properties and anchor performance is not well understood. Test results should not be assumed to be representative of expected performance in all types of concrete aggregate.

Prefabricated concrete is also referred to as “precast concrete”. Precast concrete can be made at a prefabricating plant or site-cast in forms constructed on the job. Precast concrete members may be solid or may contain hollow cores. Many precast components have thinner cross sections than cast in place concrete. Precast concrete may use either normal or lightweight concrete. Reinforced concrete contains steel bars, cable, wire mesh or random glass fibers. The addition of reinforcing material enables concrete to resist tensile stresses which lead to cracking.

The compressive strength of concrete can range from 2,000 psi to over 20,000 psi, depending on the mixture and how it is cured. Most concrete mixes are designed to obtain the desired properties within 28 days after being cast.

Concrete Masonry Units (CMU) – Block is typically formed with large hollow cores. Block with a minimum 75% solid cross section is called solid block even though it contains hollow cores. In many parts of the country building codes require steel reinforcing bars to be placed in the hollow cores, and the cores to be filled solid with grout.

In some areas of the eastern United States, past practice was to mix concrete with coal cinders to make cinder blocks. Although cinder blocks are no longer made, there are many existing buildings where they can be found. Cinder blocks require special attention as they soften with age.

Brick – Clay brick is formed solid or with hollow cores. The use of either type will vary in different parts of the United States. Brick can be difficult to drill and anchor into. Most brick is hard and brittle. Old, red clay brick is often very soft and is easily over-drilled. Either of these situations can cause problems in drilling and anchoring. The most common use of brick today is for building facades (curtain wall or brick veneer) and not for structural applications. Brick facade is attached to the structure by the use of brick ties spaced at intervals throughout the wall. In older buildings, multiple widths, or “wythes” of solid brick were used to form the structural walls. Three and four wythe walls were common wall thicknesses.

Clay Tile – Clay tile block is formed with hollow cores and narrow cavity wall cross sections. Clay tile is very brittle, making drilling difficult without breaking the block. Caution must be used in attempting to drill and fasten into clay tile.

II. Anchor Failure Modes

Four different tension failure modes and three different shear failure modes are generally observed for post-installed anchors under tension loading.

Failure Modes

Tension	Shear
Steel Fracture Breakout Pullout (Mech. Anch.) Bond Failure (Adhesive Anch.)	Steel Fracture Breakout Pryout

Breakout Failure – Breakout failure occurs when the base material ruptures, often producing a cone-shaped failure surface when anchors are located away from edges, or producing a spall when anchors are located near edges. Breakout failure can occur for both mechanical and adhesive anchors and is generally observed at shallower embedment depths, and for installations at less than critical spacings or edge distances.

Pullout Failure – Pullout failure occurs when a mechanical anchor pulls out of the drilled hole, leaving the base material otherwise largely intact.

Bond Failure – Bond failure occurs when an adhesive anchor pulls out of the drilled hole due to an adhesion failure at the adhesive-to-base-material interface, or when there is a cohesive failure within the adhesive itself. When bond failure occurs, a shallow cone-shaped breakout failure surface will often form near the base material surface. This breakout surface is not the primary failure mechanism.

Pryout Failure – Pryout failure occurs for shallowly embedded anchors when a base material failure surface is pried out “behind” the anchor, opposite the direction of the applied shear force.

Steel Fracture – Steel fracture occurs when anchor spacings, edge distances and embedment depths are great enough to prevent the base-material-related failure modes listed above and the steel strength of the mechanical anchor or adhesive anchor insert is the limiting strength.

III. Corrosion Resistance

Many environments and materials can cause corrosion, including ocean salt air, fire-retardants, fumes, fertilizers, preservative-treated wood, de-icing salts, dissimilar metals and more. Metal fixtures, fasteners and anchors can corrode and lose load-carrying capacity when installed in corrosive environments or when installed in contact with corrosive materials.

The many variables present in a building environment make it impossible to accurately predict if, or when, corrosion will begin or reach a critical level. This relative uncertainty makes it crucial that specifiers and users are knowledgeable about the potential risks and select a product suitable for the intended use. It is also prudent that regular maintenance and periodic inspections are performed, especially for outdoor applications.

It is common to see some corrosion in outdoor applications. Even stainless steel can corrode. The presence of some corrosion does not mean that load capacity has been affected or that failure is imminent. If significant corrosion is apparent or suspected, then the fixtures, fasteners and connectors should be inspected by a qualified engineer or qualified inspector. Replacement of affected components may be appropriate.

Chemical Attack - Chemical attack occurs when the anchor material is not resistant to a substance with which it is in contact. Chemical-resistance information regarding anchoring adhesives is found on page 320.

Supplemental Topics for Anchors

Some wood-preservative chemicals and fire-retardant chemicals and retentions pose increased corrosion potential and are more corrosive to steel anchors and fasteners than others. Additional information on this subject is available at www.strongtie.com.

We have attempted to provide basic knowledge on the subject of corrosion here, but it is important to fully educate yourself by reviewing our technical bulletins on the topic (www.strongtie.com/info) and also by reviewing information, literature and evaluation reports published by others.

Galvanic Corrosion - Galvanic corrosion occurs when two electrochemically dissimilar metals contact each other in the presence of an electrolyte (such as water) that acts as a conductive path for metal ions to move from the more anodic to the more cathodic metal. In the galvanic couple, the more anodic metal will corrode preferentially. The Galvanic Series of Metals table provides a qualitative guide to the potential for two metals to interact galvanically. Metals in the same group (see table) have similar electrochemical potentials. The farther the metals are apart on the table, the greater the difference in electrochemical potential, and the more rapidly galvanic corrosion will occur. Corrosion also increases with increasing conductivity of the electrolyte.

Good detailing practice, including the following, can help reduce the possibility of galvanic corrosion of anchors:

- Use of anchors and metals with similar electrochemical potentials
- Separating dissimilar metals with insulating materials
- Ensuring that the anchor is the cathode, when dissimilar materials are present.
- Preventing exposure to and pooling of electrolytes

Galvanic Series of Metals

Corroded End (Anode)
Magnesium Magnesium alloys Zinc
Aluminum 1100 Cadmium Aluminum 2024-T4 Iron and Steel
Lead Tin Nickel (active) Inconel Ni-Cr alloy (active) Hastelloy alloy C (active)
Brasses Copper Cu-Ni alloys Monel
Nickel (passive)
304 stainless steel (passive) 316 stainless steel (passive) Hastelloy alloy C (passive)
Silver Titanium Graphite Gold Platinum
Protected End (Cathode)

Hydrogen-Assisted Stress-Corrosion Cracking

Some hardened fasteners may experience premature failure if exposed to moisture as a result of hydrogen-assisted stress-corrosion cracking. These fasteners are recommended specifically for use in dry, interior locations.

Guidelines for Selecting Corrosion-Resistant Anchors and Fasteners

Evaluate the Application

Consider the importance of the connection.

Evaluate the Exposure

Consider these moisture and treatment chemical exposure conditions:

- **Dry Service:** Generally INTERIOR applications and includes wall and ceiling cavities, raised floor applications in enclosed buildings that have been designed to prevent condensation and exposure to other sources of moisture. Prolonged exposure during construction should also be considered, as this may constitute a Wet Service or Elevated Service Condition.
- **Wet Service:** Generally EXTERIOR construction in conditions other than Elevated Service. These include Exterior Protected and Exposed and General Use Ground Contact as described by the AWPA UC4A.
- **Elevated Service:** Includes fumes, fertilizers, soil, some preservative-treated wood (AWPA UC4B and UC4C), industrial zones, acid rain and other corrosive elements.
- **Uncertain:** Unknown exposure, materials or treatment chemicals.
- **Ocean/Water Front:** Marine environments that include airborne chlorides and some splash. Environments with de-icing salts are included.
- **Treatment Chemicals:** See AWPA Use Category Designations. The preservative-treated wood supplier should provide all of the pertinent information about the wood being used. The information should include Use Category Designation, wood species group, wood treatment chemical and chemical retention. See appropriate evaluation reports for corrosion effects of treatment chemicals and fastener corrosion resistance recommendations.

Use the Simpson Strong-Tie® Corrosion Classification Table

If the treatment chemical information is incomplete, Simpson Strong-Tie recommends the use of a 300-series stainless-steel product. Also if the treatment chemical is not shown in the Corrosion Classification Table, then Simpson Strong-Tie has not evaluated it and cannot make any recommendations other than the use of coatings and materials in the Severe category. Manufacturers may independently provide test results of other product information; Simpson Strong-Tie expresses no opinion regarding such information.

Minimum Corrosion Resistance Recommendations

Corrosion Resistance Classification	Material or Coating
Low	Zinc plated
Medium	Mechanically galvanized (ASTM B695-Class 55) ¹
	Hot-dip galvanized (ASTM A153-Class C)
	Type 410 stainless steel with protective top coat
High	Type 302, 303 or 304 stainless steel
Severe	Type 316 stainless steel
	Hot-dip galvanized

1. Mechanically galvanized Titen HD® anchors are recommended only for temporary outdoor service.

Supplemental Topics for Anchors

Corrosion Resistance Classifications

Environment	Material To Be Fastened						
	Untreated Wood or Other Material	Preservative-Treated Wood					FRT Wood
		SBX-DOT Zinc Borate	Chemical Retention ≤ AWPA, UC4A	Chemical Retention > AWPA, UC4A	ACZA	Other or Uncertain	
Dry Service	Low	Low	Low	High	High	High	Med
Wet Service	Med	N/A	Med	High	High	High	High
Elevated Service	High	N/A	Severe	Severe	High	Severe	N/A
Uncertain	High	High	High	Severe	High	Severe	High
Ocean/Waterfront	Severe	N/A	Severe	Severe	Severe	Severe	N/A

1. These are general guidelines that may not consider all application criteria. Refer to product-specific information for additional guidance.
2. Type 316/305/304 stainless-steel products are recommended where preservative-treated wood used in ground contact has chemical retention level greater than those for AWPA UC4A; CA-C, 0.15 pcf; CA-B, 0.21 pcf; micronized CA-C, 0.14 pcf; micronized CA-B, 0.15 pcf; ACQ-Type D (or C), 0.40 pcf.
3. Testing by Simpson Strong-Tie following ICC-ES AC257 showed that mechanical galvanization (ASTM B695, Class 55), Quik Guard coating, and Double Barrier coating will provide corrosion resistance equivalent to hot-dip galvanization (ASTM A153, Class D) in contact with chemically treated wood in dry service and wet service exposures (AWPA UC1 – UC4A, ICC-ES AC257 Exposure Conditions 1 and 3) and will perform adequately subject to regular maintenance and periodic inspection.
4. Mechanical galvanizations C3 and N2000 should not be used in conditions that would be more corrosive than AWPA UC3A (exterior, above ground, rapid water run off).
5. If uncertain about Use Category, treatment chemical, or environment, use Types 316/305/304 stainless steel, silicon bronze or copper fasteners.
6. Some treated wood may have excess surface chemicals making it potentially more corrosive than lower retentions. If this condition is suspected, use Types 316/305/304 stainless steel, silicon bronze or copper fasteners.
7. Types 316/305/304 stainless steel, silicon bronze or copper fasteners are the best recommendation for ocean salt-air and other chloride-containing environments. Hot-dip galvanized fasteners with at least ASTM A153, Class C protection can also be an alternate for some applications in environments with ocean air and/or elevated wood moisture content.

IV. Mechanical Anchors

Pre-Load Relaxation

Expansion anchors that have been set to the required installation torque in concrete will experience a reduction in pre-tension (due to torque) within several hours. This is known as pre-load relaxation. The high compression stresses placed on the concrete cause it to deform which results in a relaxation of the pre-tension force in the anchor. Tension in this context refers to the internal stresses induced in the anchor as a result of applied torque and does not refer to anchor capacity. Historical data shows it is normal for the initial tension values to decrease by as much as 40–60% within the first few hours after installation. Retorquing the anchor to the initial installation torque is not recommended or necessary.

Oversized Holes

The performance data for adhesive anchors are based upon anchor tests in which holes were drilled with carbide-tipped drill bits of the same diameter listed in the product's load table. Additional static tension tests were conducted to qualify anchors installed with SET, SET-XP®, ET-HP® and AT adhesives for installation in holes with diameters larger than those listed in the load tables. The tables indicate the acceptable range of drilled hole sizes and the corresponding tension-load reduction factor (if any). The same conclusions also apply to the published shear load values. Drilled holes outside of the accepted range shown in the charts are not recommended.

SET Adhesive – Acceptable Hole Diameter

Insert Diameter (in.)	Acceptable Hole Diameter Range (in.)	Acceptable Load Reduction Factor
3/8	1/2 – 3/4	1.0
1/2	5/8 – 1 1/16	1.0
5/8	3/4 – 1 1/8	1.0
3/4	7/8 – 1 5/16	1.0
7/8	1 – 1 1/2	1.0
1	1 1/8 – 1 11/16	1.0
1 1/8	1 1/4 – 1 7/8	1.0
1 1/4	1 3/8 – 2 1/16	1.0
1 3/8	1 1/2 – 2 1/4	1.0

SET-XP and ET-HP Adhesives – Acceptable Hole Diameter

Insert Diameter (in.)	Acceptable Hole Diameter Range (in.)	Acceptable Load Reduction Factor
1/2	5/8 – 3/4	1.0
5/8	3/4 – 1 1/16	1.0
3/4	7/8 – 1 1/8	1.0
7/8	1 – 1 5/16	1.0
1	1 1/8 – 1 1/2	1.0
1 1/4	1 3/8 – 1 7/8	1.0

V. Adhesive Anchors

Installation into Green Concrete

The strength design data for adhesive anchors in this catalog are based on installations into concrete that is at least 21 days old. Anchors may be installed in concrete less than 21 days old, provided a reduction factor is applied to bond strength:

Products	Concrete Age When Installed	Concrete Age When Loaded	Bond Strength Factor
AT AT-XP ET-HP SET SET-XP	14 days	21 days	1.0
		7 days	0.9
	7 days	21 days	1.0
		7 days	0.7

Supplemental Topics for Anchors

AT Adhesive – Acceptable Hole Diameter

Insert Diameter (in.)	Acceptable Hole Diameter Range (in.)	Acceptable Load Reduction Factor
3/8	7/16 – 1/2	1.0
1/2	9/16 – 5/8	1.0
5/8	1 1/16 – 3/4	1.0
3/4	1 3/16 – 7/8	1.0
7/8	1	1.0
1	1 1/16 – 1 1/8	.75 for 1 1/8 only

Core-Drilled Holes

The performance data for adhesive anchors are based upon anchor tests in which holes were drilled with carbide-tipped drill bits. Additional static tension tests were conducted to qualify anchors installed with SET and AT anchoring adhesives for installation in holes drilled with diamond-core bits. In these tests, the diameter of the diamond-core bit matched the diameter of the carbide-tipped drill bit recommended in the product's load table. The test results showed that no reduction of the published allowable tension load for SET and AT anchoring adhesives is necessary for this condition. The same conclusions also apply to the published allowable shear loads.

Installation in Damp, Wet and Submerged Environments

SET-XP, ET-HP and AT-XP: The performance data for adhesive anchors using SET-XP, ET-HP and AT-XP adhesives are based upon tests according to ICC-ES AC308. This criteria requires adhesive anchors that are to be installed in outdoor environments to be tested in water-saturated concrete holes that have been cleaned with less than the amount of hole cleaning recommended by the manufacturer. A product's sensitivity to this installation condition is considered in determining the product's "Anchor Category" (strength reduction factor). SET-XP, ET-HP and AT-XP may be installed in dry or water-saturated concrete.

Based on Reliability Testing per ICC-ES AC308

- Dry Concrete – Cured concrete whose moisture content is in equilibrium with surrounding non-precipitate atmospheric conditions.
- Water-Saturated Concrete – Cured concrete that is covered with water and water saturated.
- Submerged Concrete – Cured concrete that is covered with water and water saturated.
- Water-Filled Hole – Drilled hole in water-saturated concrete that is clean yet contains standing water at the time of installation.

SET, EDOT and AT: The performance data for adhesive anchors using SET, EDOT and AT adhesives are based upon tests in which anchors are installed in dry holes. Additional static tension tests were conducted for some products in damp holes, water-filled holes and submerged holes. The test results show that no reduction of the published allowable tension load is necessary for SET, EDOT and AT adhesives in damp holes, or for SET and AT adhesives in water-filled holes. For SET and AT adhesives in submerged holes, the test results show that a reduction factor of 0.60 is applicable. The same conclusions also apply to the published allowable shear load values.

Based on Reliability Testing per ICC-ES AC58

- Dry Concrete – Cured concrete whose moisture content is in equilibrium with surrounding non-precipitate atmospheric conditions.
- Damp Hole – A damp hole, as defined in ASTM E1512 and

referenced in ICC-ES AC58, is a drilled hole that has been properly drilled, cleaned and then is filled with standing water for seven days. After seven days, the standing water is blown out of the hole with compressed air and the adhesive anchor is installed.

- Water-Filled Hole – A water-filled hole is defined similarly to a damp hole; however, the standing water is not blown out of the hole. Instead, the adhesive is injected directly into the water-filled hole (from the bottom of the hole up) and the insert is installed.
- Submerged Hole – A submerged hole is similar to a water-filled hole with one major exception – in addition to standing water within the hole, water also completely covers the surface of the base material. Note that drilling debris and sludge should be removed from the drilled hole prior to installation. ICC-ES AC58 does not address this condition.

Elevated In-Service Temperature

The performance of all adhesive anchors is affected by elevated base material temperature. The in-service temperature sensitivity table provided for each adhesive provides the information necessary to apply the appropriate load adjustment factor to either the allowable tension based on bond strength or allowable shear based on concrete edge distance for a given base material temperature. While there is no commonly used method to determine the exact load-adjustment factor, there are a few guidelines to keep in mind when designing an anchor that will be subject to elevated base-material temperature. In any case, the final decision must be made by a qualified design professional using sound engineering judgment:

- When designing an anchor connection to resist wind and/or seismic forces only, the effect of fire (elevated temperature) may be disregarded.
- The base-material temperature represents the average internal temperature and, hence, the temperature along the entire bonded length of the anchor.
- The effects of elevated temperature may be temporary. If the in-service temperature of the base material is elevated such that a load-adjustment factor is applicable but, over time, the temperature is reduced to a temperature below which a load-adjustment factor is applicable, the full allowable load based on bond strength is still applicable. This is applicable provided that the degradation temperature of the anchoring adhesive (350°F for SET-XP®, SET, ET-HP®, AT-XP® and AT adhesives) has not been reached.

Creep Under Long-Term Loads

Creep is the slow, continuous deformation of a material under constant stress. Creep occurs in many construction materials, including concrete and steel when the stress is great enough. The creep characteristics of adhesives are product-dependent. Adhesive anchors that are not creep-resistant can pull out slowly over time when sustained tensile loads are applied.

Because of the creep phenomenon, it is important for Designers to consider the nature of the applied tension loads and to determine whether the tension loads will be continuously applied to the anchor over the long term. If this is the case, a product that is suitable for resisting sustained loads over the long term must be selected.

All Simpson Strong-Tie® anchoring adhesives (SET-XP, SET, ET-HP, EDOT, AT-XP and AT) have been qualified for resisting long-term loads through ICC-ES AC58 or ICC-ES AC308 "creep tests" in which an anchor is loaded and monitored for movement over time. According to AC58 and AC308, anchors that pass the creep test are determined to be suitable for resisting long-term tensile loads.

Supplemental Topics for Anchors

Chemical Resistance of Adhesive Anchors

Samples of Simpson Strong-Tie® anchoring adhesives were immersed in the chemicals shown below until they exhibited minimal weight change (indicating saturation) or for a maximum of three months. The samples were then tested according to ASTM D 543 *Standard Practices for Evaluating the Resistance of Plastics to Chemical Changes*, Procedures I & II, and either ASTM D 790 *Standard Test Method for Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulating Materials* or ASTM D 695 *Standard Test Method for Compressive Properties of Rigid Plastics*. In cases where mild chemicals were evaluated, the exposure was accelerated per ASTM D 3045 *Standard Practice for Heat Aging of Plastics Without Load*.

Samples showing no visible damage and demonstrating statistically equivalent strength and elastic modulus as compared to control samples were classified as “Resistant” (R). These adhesives are considered suitable for continuous exposure to the identified chemical when used as a part of an adhesive anchor assembly.

Samples exhibiting slight damage, such as swelling or crazing, or not demonstrating both statistically equivalent strength and elastic modulus as compared to control samples were classified as “Non-Resistant” (NR). These adhesives are considered suitable for periodic exposure to the identified chemical if the chemical will be diluted and washed away from the adhesive anchor assembly after exposure, or if only emergency contact with the chemical is expected and subsequent replacement of the anchor would be undertaken. Some manufacturers refer to this as “limited resistance” or “partial resistance” in their literature.

Samples that were completely destroyed by the chemical, or that demonstrated a significant loss in strength after exposure were classified as “Failed” (F). These adhesives are considered unsuitable for exposure to the identified chemical.

Note: In most actual service conditions, the majority of the anchoring adhesive is not exposed to the chemical and thus some period of time is required for the chemical to saturate the entire adhesive. An adhesive anchor would be expected to maintain bond strength and creep resistance until a significant portion of the adhesive is saturated.

Chemical	Concentration	AT-XP	SET-XP	ET-HP	AT	SET

Allowable Stress Design (ASD) Method

In allowable stress design (ASD), the Designer must size the anchorage such that the service load does not exceed the allowable load for any anchor:

$$\begin{aligned} T_{service} &\leq T_{allowable} \\ V_{service} &\leq V_{allowable} \end{aligned}$$

The Designer must read the allowable load from the applicable table and adjust the allowable load for all applicable design parameters for the anchor, such as spacing, edge distance, in-service temperature or allowable-stress increase for short-term loads. Load-adjustment factors for anchors are applied cumulatively. For adhesive anchors, the designer must also ensure that the service load does not exceed the allowable load of the steel insert.

For anchors subjected to simultaneous tension and shear loading, the following equation must be satisfied, where the value of n is product-specific. Use a value of $n=1$ unless otherwise specified in the applicable products' load table.

$$\left(\frac{T_{service}}{T_{allowable}}\right)^n + \left(\frac{V_{service}}{V_{allowable}}\right)^n \leq 1.0$$

Linear interpolation of allowable loads between embedment depths and/or compressive strengths shown in the load tables is permitted. Linear interpolation of load-adjustment factors in the edge distance and spacing tables is also permitted.

The allowable loads in this catalog are derived from full-scale testing, calculations, and/or experience. In general, the allowable load is determined by taking the average ultimate load from full scale tests and dividing by a safety factor (Ω).

$$T_{allowable} = \frac{\bar{T}_{ultimate}}{\Omega}; \quad V_{allowable} = \frac{\bar{V}_{ultimate}}{\Omega}$$

For some anchors, the average ultimate load and/or allowable load is also controlled by anchor displacement limits.

The allowable loads for steel inserts used with adhesive anchors is determined as follows:

For threaded rod: $T_{allowable} = 0.33F_u A_g$; $V_{allowable} = 0.17F_u A_g$

For Grade 60 rebar: $T_{allowable} = (24,000 \text{ psi})A_g$; $V_{allowable} = 0.17(90,000 \text{ psi})A_g$

Where:

A_g = Gross cross-sectional area of the insert

Threaded Insert Steel Type	F _u (psi)
F1554, Grade 36	58,000
A193, Grade B7	125,000
304/316 Stainless (Diam. ≤ 5/8")	100,000
304/316 Stainless (Diam. ≥ 3/4")	85,000

Where:

F_u = Ultimate tensile strength of steel insert

Strength Design (SD) Method (Under ACI 318 APPENDIX D, ICC-ES AC193, and ICC-ES AC308)

In strength design (SD), the Designer must size the anchorage such that the required strength (i.e. factored load) does not exceed the lowest design strength of the anchor or anchor group considering all possible failure modes.

$$N_{ua} \leq \phi N_n$$

$$V_{ua} \leq \phi V_n$$

Calculations are performed in accordance with the applicable design standards: ICC-ES AC193 and ACI 318 Appendix D for mechanical anchors and ICC-ES AC308 for adhesive anchors. The additional design provisions of AC308 are shown elsewhere in this catalog.

The nominal strengths and design data in this catalog are derived from testing and calculations in accordance with ACI 355.2. ACI 355.4, ICC-ES AC193 and ICC-ES AC308. In general, nominal strengths are 5% fractile strengths calculated using the average ultimate load, and standard deviation of full-scale test results. A 5% fractile strength is the nominal strength for which there is a 90% confidence that there is a 95% probability of the actual strength exceeding the nominal strength.

For anchors that are designed using ACI 318 Appendix D, AC193, or AC308, it is possible to convert design strengths (i.e. ϕN_n or ϕV_n) to allowable loads using the following approach from AC193:

$$T_{allowable, ASD} = \frac{\phi N_n}{\alpha} \quad \text{and} \quad V_{allowable, ASD} = \frac{\phi V_n}{\alpha}$$

Where:

$T_{allowable, ASD}$ = Allowable tension load

$V_{allowable, ASD}$ = Allowable shear load

ϕN_n = Lowest design strength of an anchor or anchor group in tension as determined per ACI 318 Appendix D, AC193, AC308 and the IBC.

ϕV_n = Lowest design strength of an anchor or anchor group in shear as determined per ACI 318 Appendix D, AC193, AC308 and the IBC.

α = Conversion factor calculated as a weighted average of the load factors for the controlling load combination. In addition, α shall include all applicable factors to account for non-ductile failure modes and required over-strength.

Interaction shall be calculated as follows:

For tension loads, $T \leq 0.2T_{allowable}$ the full allowable load in shear shall be permitted.

For shear loads, $V \leq 0.2V_{allowable}$ the full allowable load in tension shall be permitted.

$$\text{For all other cases: } \frac{T}{T_{allowable}} + \frac{V}{V_{allowable}} \leq 1.2$$

AC308 Modifications to ACI 318

4.2.1 Replace Section D.5.5.5, and add Sections D.5.3.7 and D.8.6.1 to ACI 318 as follows:

4.2.2 D.5.5.5 – The modification factor for adhesive anchors designed for uncracked concrete in accordance with D.5.5.2 without supplementary reinforcement to control splitting, $\psi_{cp,Na}$, shall be computed as:

$$\text{If } c_{a,min} \geq c_{ac} \text{ then } \psi_{cp,Na} = 1.0 \quad (\text{D-26})$$

$$\text{If } c_{a,min} < c_{ac} \text{ then } \psi_{cp,Na} = \frac{c_{a,min}}{c_{ac}} \quad (\text{D-27})$$

where

c_{ac} shall be determined in accordance with Eq. (D-27a) for anchor diameters up to 1¼ inches and for characteristic bond strengths in uncracked concrete less than or equal to 3,000 psi, and Eq. (D-27b) for anchor diameters larger than 1¼ inches or for characteristic bond strengths in uncracked concrete greater than 3,000 psi.

$$c_{ac} = h_{ef} \cdot \left(\frac{\tau_{k,uncr}}{1160} \right)^{0.4} \cdot \left[3.1 - 0.7 \frac{h}{h_{ef}} \right] \quad (\text{D-27a})$$

$$c_{ac} = h_{ef} \cdot \left(\frac{\tau_{k,uncr}}{664} \right)^{0.4} \cdot \left[3.1 - 0.7 \frac{h}{h_{ef}} \right] \quad (\text{D-27b})$$

where

$\left[\frac{h}{h_{ef}} \right]$ need not be taken as larger than 2.4; and

$\tau_{k,uncr}$ = characteristic bond strength stated in the Evaluation Service Report whereby $\tau_{k,uncr}$ need not be taken as larger than:

$$\tau_{k,uncr} = \frac{k_{uncr} \sqrt{h_{ef} f'_c}}{\pi \cdot d}$$

In no case shall $\psi_{cp,Na}$ determined from Eq. (D-27) be taken as less than c_{Na} / c_{ac} . For all other cases, $\psi_{cp,Na}$ shall be taken as 1.0.

NOTE: Bond strength determination: Bond strength values are a function of the special-inspection level provided and installation conditions. Bond strength values must be modified with the factor K_{sat} for cases where the holes are drilled in water-saturated concrete as follows:

Special Inspection Level	Permissible Installation Condition	Bond Strength	Associated Strength Reduction Factor
Continuous	Dry Concrete	τ_k	$\Phi_{dry,ci}$
Continuous	Water-saturated	$\tau_k \times K_{sat,ci}$	$\Phi_{sat,ci}$
Periodic	Dry Concrete	τ_k	$\Phi_{dry,pi}$
Periodic	Water-saturated	$\tau_k \times K_{sat,pi}$	$\Phi_{sat,pi}$

Where applicable, the modified bond strengths must be used in lieu of $\tau_{k,cr}$ or $\tau_{k,uncr}$ in ACI 318. The resulting nominal bond strength must be multiplied by the strength-reduction factor for the special-inspection level listed above.

Example Calculations Adhesive Anchors (Traditional ASD)

Example calculation for a grouping of adhesive anchors using ASD:

Design a connection comprised of four ¾" diameter all-thread rods installed in $f'_c = 2,000$ psi concrete using SET adhesive as shown. The anchor grouping is subject to an applied tension load of 3,000 lb. and an applied shear load of 1,000 lb. acting simultaneously.

ADDITIONAL DATA:

- All-thread rod material: ASTM A1554 Grade 36.
- All-thread rod embedment depth: 6¾"
- All-thread rod spacing: S1=S3=8", S2=11.3" (use 11")
($S_{critical} = 27" > S_{actual}$, therefore reduced efficiency.)
- All-thread rod edge distance: C1=C2=3"
($C_{critical} = 10\frac{1}{8}" > C_{actual}$, therefore reduced efficiency.)

SOLUTION:

Unadjusted allowable tension loads:

- Based on adhesive bond strength = $T_{bond} = 10,525$ lbs.
- Based on steel strength = $T_{steel} = 8,460$ lbs.

Unadjusted allowable shear loads:

- Based on concrete strength = $V_{conc} = 6,310$ lbs.
- Based on steel strength = $V_{steel} = 4,360$ lbs.

Calculate reduced efficiency factors for all-thread rod installed at an edge distance of 3" using tables on pages 116–117:

- Tension: C1=C2=3", $f_c = 0.56$ from f_c - Tension Table
- Shear: C1=C2=3", $f_c = 0.29$ from f_c - Shear Table

Calculate reduced efficiency factors for all-thread rod installed at a spacing of 8" using tables on pages 118–119:

- Tension: S1=S3=8", $f_s = 0.91$ from f_s - Tension Table
S2=11", $f_s = 0.925$ from f_s - Tension Table
- Shear: S1=S3=8", $f_s = 0.95$ from f_s - Shear Table
S2=11", $f_s = 1.00$ from f_s - Shear Table

Reduce allowable tension value based on bond strength. The reduction factors are cumulative due to the influence of two reduced edge distance conditions and three reduced spacing conditions:

$$\begin{aligned} (T_{bond})_{net} &= (f_c)(f_s)(T_{bond}) \\ &= (0.56 \times 0.56)(0.91 \times 0.91 \times 0.925)(10,525 \text{ lbs.}) \\ &= 2,528 \text{ lbs.} \end{aligned}$$

Allowable tension value is the lesser of:

- Tension based on net bond strength = **2,528 lbs.** (governs) or
- Tension based on steel strength = 8,460 lbs.

For a group of 4 anchors the combined allowable tension value is:

$$\begin{aligned} &= (4 \text{ anchors})(2,528 \text{ lbs./anchor}) = \mathbf{10,112 \text{ lbs.} > 3,000 \text{ lbs.}} \\ &\text{(design tension) O.K.} \end{aligned}$$

(Note: If high in-service temperature is expected, the allowable based on bond/concrete should be multiplied by a strength reduction factor found in the adhesive's temperature sensitivity table.)

Reduce allowable shear value based on concrete strength. The reduction factors are cumulative due to the influence of two reduced edge-distance conditions and three reduced spacing conditions:

$$\begin{aligned} (V_{conc})_{net} &= (f_c)(f_s)(V_{conc}) \\ &= (0.29 \times 0.29)(.95 \times .95 \times 1.00)(6,310 \text{ lbs.}) \\ &= 478 \text{ lbs.} \end{aligned}$$

Allowable shear value is the lesser of:

- Shear based on net concrete strength = **478 lbs.** (governs) or
- Shear based on steel strength = 4,360 lbs.

For a group of 4 anchors the combined allowable shear value is:

$$\begin{aligned} &= (4 \text{ anchors})(478 \text{ lbs./anchor}) = \mathbf{1,912 \text{ lbs.} > 1,000 \text{ lbs.}} \\ &\text{(design shear) O.K.} \end{aligned}$$

(Note: If high in-service temperature is expected, the allowable shear based on bond/concrete should be multiplied by a strength reduction factor found in the adhesive's temperature sensitivity table.)

The allowable tension (or shear) value for a group of anchors is equal to the lowest (minimum) tension (or shear) value for a single anchor within the group multiplied by the number of anchors within the group.

CHECK COMBINED TENSION AND SHEAR INTERACTION:

For adhesive anchors, use the straight-line method ($n=1.0$, see Figure 1) when calculating the interaction of both tension and shear upon the anchor per the following equation:

$$(\text{Design shear/allowable shear})^n + (\text{Design tension/allowable tension})^n \leq 1.0, n=1.0$$

Design shear (V) = 1,000 lbs.

Allowable shear (V_{all}) = 1,912 lbs.

Design tension (T) = 3,000 lbs.

Allowable tension (T_{all}) = 10,112 lbs.

$$(1,000/1,912)^{1.0} + (3,000/10,112)^{1.0} = 0.82 \leq 1.0 \text{ O.K.}$$

Figure 1

Example Calculations Mechanical Anchors (Traditional ASD)

Example calculation for a group of (2) Titen HD® anchors using ASD:

Design a connection comprised of two (2) ¾" diameter Titen HD® anchors installed in the face of an 8" normal weight grouted CMU wall as shown. The anchor group has an applied tension load of 600 lbs. and an applied shear load of 500 lbs. acting simultaneously.

ADDITIONAL DATA:

- Embedment depth = 5 ½"
- Spacing = $S_{act} = S1 = 8"$
- Critical spacing for ¾" dia. anchor at embedment = $S_{cr} = 12"$
- $S_{act} < S_{cr}$ therefore use spacing reduction factor for S1.
- End distance = $C_{act} = C1 = 4"$
- Edge distance = $C_{act} = C2 = 12"$
- Critical edge distance = $C_{cr} = 12"$
- Critical end distance = $C_{cr} = 12"$
- $C1 < C_{cr}$, therefore use perpendicular-to-edge reduction factor for C1.
- $C2 > C_{cr}$, therefore no edge reduction factor for C2.

SOLUTION:

Tension

Determine uninfluenced allowable tension load in the face of an 8" normal wt. concrete grouted CMU wall:

Uninfluenced allowable tension = 1,600 lbs.

Calculate reduced efficiency factors for Edge Distance:

$$C_{act} = C1 = 4"$$

$$C_{act} = C2 = 12"$$

$$f_{cC1} = 0.66 = \text{Load adjustment factor (pages 198–199)}$$

Calculate reduced efficiency factor for spacing:

$$S_{act} = S1 = 8"$$

$$f_{sS1} = 0.67 = \text{Load adjustment factor (page 200)}$$

Calculate allowable tension load per anchor:

$$\text{Allowable tension} = (\text{uninfluenced allowable tension}) (f_{cC1}) (f_{sS1})$$

$$\text{Allowable tension} = (1,600 \text{ lbs.}) (0.66) (0.67) = 708 \text{ lbs. per anchor}$$

For a group of 2 anchors the combined allowable tension value is:
= (2 anchors)(708 lbs./anchor) = **1,416 lbs. > 600 lbs.**
(design tension) O.K.

Shear

Determine uninfluenced allowable shear load in the face of an 8" normal wt. concrete grouted CMU wall:

Uninfluenced allowable shear = 3,000 lbs.

Calculate reduced efficiency factor for end distance:

$$C_{act} = C1 = 4"$$

$$C_{act} = C2 = 12"$$

$$f_{cC1} = 0.21 = \text{Load adjustment factor (pages 198–199)}$$

Calculate reduced efficiency factor for spacing:

$$S_{act} = S1 = 8"$$

$$f_{sS1} = 0.75 = \text{Load adjustment factor (page 200)}$$

Calculate allowable shear load per anchor:

$$\text{Allowable shear} = (\text{uninfluenced allowable shear}) (f_{cC1}) (f_{sS1})$$

$$\text{Allowable shear} = (3,000 \text{ lbs.}) (0.21) (0.75) = 473 \text{ lbs. per anchor}$$

For a group of 2 anchors the combined allowable shear value is:
= (2 anchors)(473 lbs./anchor) = **945 lbs. > 500 lbs.**
(design shear) O.K.

The allowable tension (or shear) value for a group of anchors is equal to the lowest (minimum) tension (or shear) value for a single anchor within the group multiplied by the number of anchors within the group.

CHECK COMBINED TENSION AND SHEAR INTERACTION:

For the Titen HD® in grouted CMU, use the straight-line method ($n = 1$, see Figure 1) when calculating the interaction of both tension and shear upon the anchor per the following equation:

$$(\text{Design shear}/\text{Allowable shear})^n + (\text{Design tension}/\text{Allowable tension})^n \leq 1.0, n = 1$$

$$\text{Design shear (V)} = 500 \text{ lbs.}$$

$$\text{Allowable shear (V}_{all}) = 945 \text{ lbs.}$$

$$\text{Design tension (T)} = 600 \text{ lbs.}$$

$$\text{Allowable tension (T}_{all}) = 1,416 \text{ lbs.}$$

$$(600/1,416)^1 + (500/945)^1 = 0.95 \leq 1.0 \text{ O.K.}$$

Figure 1

Example Calculations Mechanical Anchors (ACI 318 App. D / ICC-ES AC193)

Example calculation for a single Strong-Bolt™ 2 anchor using SD:

Determine if a single 1/2" diameter carbon-steel Strong-Bolt™ 2 torque-controlled expansion anchor with a minimum 3 7/8" embedment ($h_{ef} = 3 7/8$ inches) installed 4" from the edge of a 12" deep spandrel beam is adequate for a strength level tension load of 1,600 lb. for wind and a reversible strength level shear load of 560 lb. for wind. The anchor will be in the tension zone, away from other anchors in $f'_c = 3,000$ psi normal-weight concrete.

Reference the appropriate tables in this catalog for Strong-Bolt 2 anchor performance values as determined from testing in accordance with ACI 355.2 and ICC-ES AC193.

CALCULATIONS AND DISCUSSION

Note: Calculations are performed in accordance with ACI 318-11.

- Determine the factored tension and shear design loads:

$$N_{ua} = 1.0W = 1.0 \times 1,600 = 1,600 \text{ lb.}$$

$$V_{ua} = 1.0W = 1.0 \times 560 = 560 \text{ lb.}$$

- Design considerations:

This is a combined tension and shear interaction problem where values for both ϕN_n and ϕV_n need to be determined. ϕN_n is the lesser of the design tension strength controlled by: steel (ϕN_{sa}), concrete breakout (ϕN_{cb}), or pull-out ($\phi n N_{pn}$). ϕV_n is the lesser of the design shear strength controlled by: steel (ϕV_{sa}), concrete breakout (ϕV_{cb}), or pryout (ϕV_{cp}).

- Steel capacity under tension Loading:

$$\phi N_{sa} \geq N_{ua}$$

$$N_{sa} = 12,100 \text{ lb.}$$

$$\phi = 0.75$$

$$n = 1 \text{ (single anchor)}$$

Calculating for ϕN_{sa} :

$$\phi N_{sa} = 0.75 \times 1 \times 12,100 = 9,075 \text{ lb.} > 1,600 \text{ lb. O.K.}$$

This catalog

CALCULATIONS AND DISCUSSION

- Concrete breakout capacity under tension loading:

$$\phi N_{cb} \geq N_{ua}$$

$$N_{cb} = \frac{A_{Nc}}{A_{Nco}} \psi_{ed,N} \psi_{c,N} \psi_{cp,N} N_b$$

where:

$$N_b = k_c \lambda_a \sqrt{f'_c} h_{ef}^{1.5}$$

substituting:

$$\phi N_{cb} = \phi \frac{A_{Nc}}{A_{Nco}} \psi_{ed,N} \psi_{c,N} \psi_{cp,N} k_c \lambda_a \sqrt{f'_c} h_{ef}^{1.5}$$

where:

$$k_c = k_{cr} = 17$$

(Anchor is installed in a tension zone, therefore, cracking is assumed at service loads)

$$\lambda = 1.0 \text{ for normal-weight concrete}$$

$$\psi_{cp,N} = 1.0$$

$$\psi_{ed,N} = 0.7 + 0.3 \frac{c_{a,min}}{1.5h_{ef}} \text{ when } c_{a,min} < 1.5h_{ef}$$

by observation, $c_{a,min} = 4 < 1.5h_{ef}$

$$\psi_{ed,N} = 0.7 + 0.3 \frac{(4)}{1.5(3.375)} = 0.94$$

$\psi_{c,N} = 1.0$ assuming cracking at service loads ($f_t > f_t$)

$$\phi = 0.65 \text{ for Condition B}$$

(no supplementary reinforcement provided)

$$A_{Nco} = 9h_{ef}^2 = 9(3.375)^2 = 102.52 \text{ in.}^2$$

$$A_{Nc} = (c_{a1} + 1.5h_{ef})(2 \times 1.5h_{ef}) = (4 + 1.5(3.375))(2 \times 1.5(3.375)) = 91.76 \text{ in.}^2$$

$$\frac{A_{Nc}}{A_{Nco}} = \frac{91.76}{102.52} = 0.90$$

Calculating for ϕN_{cb} :

$$\phi N_{cb} = 0.65 \times 0.90 \times 0.94 \times 1.0 \times 1.0 \times 17 \times 1.0 \times \sqrt{3,000} \times (3.375)^{1.5} = 3,175 \text{ lb.} > 1,600 \text{ lb. O.K.}$$

Example Calculations Mechanical Anchors (ACI 318 App. D / ICC-ES AC193)

CALCULATIONS AND DISCUSSION

5. Pullout capacity under tension loading:

Pullout capacity, $N_{p,cr}$, is established by reference tests in cracked concrete by the reliability test of ACI 355.2. Data from the anchor prequalification testing must be used. Reference Strong-Bolt® 2 anchor "characteristic tension design values" table for the 5 percent fractile value, $N_{p,cr}$.

$$\phi N_{pn} \geq N_{ua}$$

$$N_{p,cr} = 3,735 \times \left(\frac{3,000}{2,500} \right)^{0.5} = 4,091 \text{ lb.}$$

$$\phi = 0.65$$

$$\phi N_{pn} = 0.65 \times 4,091 = 2,659 \text{ lb.} > 1,600 \text{ lb. O.K.}$$

6. Check all failure modes under tension loading:

Summary:

$$\text{Steel capacity} = 9,075 \text{ lb.}$$

$$\text{Concrete breakout capacity} = 3,175 \text{ lb.}$$

$$\text{Pullout capacity} = 2,659 \text{ lb.} \leftarrow \text{Controls}$$

$\therefore \phi N_n = 2,659 \text{ lb. as pullout capacity controls}$

7. Steel capacity under shear loading:

$$\phi V_{sa} \geq V_{ua}$$

$$V_{sa} = 7,235 \text{ lb.}$$

$$\phi = 0.65$$

Calculating for ϕV_{sa} :

$$\phi V_{sa} = 0.65 \times 7,235 = 4,703 \text{ lb.} > 560 \text{ lb. O.K.}$$

8. Concrete breakout capacity under shear loading:

$$\phi V_{cb} \geq V_{ua}$$

$$V_{cb} = \frac{A_{Vc}}{A_{Vco}} \psi_{ed,v} \psi_{c,v} \psi_{h,v} V_b$$

where:

$$V_b = 7 \left(\frac{\ell_e}{d_a} \right)^{0.2} \sqrt{d_a} \lambda_a \sqrt{f'_c} c_{a1}^{1.5}$$

substituting:

$$\phi V_{cb} = \phi \frac{A_{Vc}}{A_{Vco}} \psi_{ed,v} \psi_{c,v} \psi_{h,v} 7 \left(\frac{\ell_e}{d_a} \right)^{0.2} \sqrt{d_a} \lambda_a \sqrt{f'_c} c_{a1}^{1.5}$$

where:

$$\phi = 0.70 \text{ for Condition B}$$

(no supplementary reinforcement provided)

$$A_{Vco} = 4.5c_{a1}^2$$

$$= 4.5(4)^2$$

$$\therefore A_{Vco} = 72 \text{ in.}^2$$

$$A_{Vc} = 2(1.5c_{a1})(1.5c_{a1})$$

$$= 2(1.5(4))(1.5(4))$$

$$\therefore A_{Vc} = 72 \text{ in.}^2$$

$$\frac{A_{Vc}}{A_{Vco}} = \frac{72}{72} = 1$$

$$h_a = 12 \text{ in.}$$

$$\psi_{h,v} = 1.0 \text{ since } h_a > 1.5 c_{a1}$$

$$\psi_{ed,v} = 1.0 \text{ since } c_{a2} > 1.5c_{a1}$$

$$\psi_{c,v} = 1.0 \text{ assuming cracking at service loads } (f_t > f_r)$$

$$d_a = 0.5 \text{ in.}$$

$$\ell_e = 3.375 \text{ in.}$$

$$\lambda_a = 1.0 \text{ for normal-weight concrete}$$

$$c_{a1} = 4 \text{ in.}$$

$$\phi V_{cb} = 0.70 \times 1 \times 1.0 \times 1.0 \times 1.0 \times 7 \times \left(\frac{3.375}{0.5} \right)^{0.2} \times \sqrt{0.5} \times 1.0$$

$$\times \sqrt{3,000} \times (4)^{1.5} = 2,224 \text{ lb.} > 560 \text{ lb. O.K.}$$

CALCULATIONS AND DISCUSSION

9. Concrete pryout strength:

$$\phi n V_{cp} \geq V_{ua}$$

$$V_{cp} = k_{cp} N_{cb}$$

where:

$$n = 1$$

$$k_{cp} = 2.0 \text{ and } \phi = 0.70$$

$$k_{cp} N_{cb} = 2.0 \times \frac{3,175}{0.65} = 9,769 \text{ lb.}$$

$$\phi n V_{cp} = 0.70 \times 1 \times 9,769 = 6,838 \text{ lb.} > 560 \text{ lb. O.K.}$$

10. Check all failure modes under shear Loading:

Summary:

$$\text{Steel capacity} = 4,703 \text{ lb.}$$

$$\text{Concrete breakout capacity} = 2,224 \text{ lb.} \leftarrow \text{Controls}$$

$$\text{Pryout capacity} = 6,838 \text{ lb.}$$

$\therefore \phi V_n = 2,224 \text{ lb. as concrete breakout capacity controls}$

11. Check interaction of tension and shear forces:

If $0.2 \phi V_n \geq V_{ua}$, then the full tension design strength is permitted.

By observation, this is not the case.

If $0.2 \phi N_n \geq N_{ua}$, then the full shear design strength is permitted

By observation, this is not the case.

Therefore:

$$\frac{N_{ua}}{\phi N_n} + \frac{V_{ua}}{\phi V_n} \leq 1.2$$

$$\frac{1,600}{2,659} + \frac{560}{2,224} = 0.60 + 0.25 = 0.85 < 1.2 \text{ O.K.}$$

12. Summary

A single 1/2" diameter carbon-steel Strong-Bolt® 2 anchor at a 3 7/8" embedment depth is adequate to resist the applied strength level tension and shear wind loads of 1,600 lb. and 560 lb., respectively.

Example Calculations Adhesive Anchors (ACI 318 App.D / ICC-ES AC308)

Example calculation for a single SET-XP® epoxy adhesive anchor using SD:

Determine if a single 1/2" diameter ASTM A193 Grade B7 anchor rod in SET-XP® epoxy adhesive anchor with a minimum 4 1/2" embedment ($h_{ef} = 4\frac{1}{2}"$) installed 1 3/4" from the edge of a 12" deep spandrel beam is adequate for a strength level tension load of 1,040 lb. for wind and a reversible strength level shear load of 440 lb. for wind. The anchor will be in the tension zone, away from other anchors in $f'_c = 3,000$ psi normal-weight concrete (dry). The anchor will be subjected to a maximum short-term temperature of 150°F and a maximum long-term temperature of 110°F. Continuous inspection will be provided

Reference the appropriate tables in this catalog for SET-XP epoxy adhesive anchor performance values as determined from testing in accordance with ACI 355.4 and ICC-ES AC308.

CALCULATIONS AND DISCUSSION

REFERENCE

Note: Calculations are performed in accordance with ICC-ES AC308 and ACI 318-11.

1. Determine the factored tension and shear design loads:

ACI 318, 9.2.1

$$N_{ua} = 1.0W = 1.0 \times 1,040 = 1,040 \text{ lb.}$$

$$V_{ua} = 1.0W = 1.0 \times 440 = 440 \text{ lb.}$$

2. Design considerations:

D.4.1.1

This is a combined tension and shear interaction problem where values for both ϕN_n and ϕV_n need to be determined. ϕN_n is the lesser of the design tension strength controlled by: steel (ϕN_{sa}), concrete breakout (ϕN_{cb}), or adhesive (ϕN_a). ϕV_n is the lesser of the design shear strength controlled by: steel (ϕV_{sa}), concrete breakout (ϕV_{cb}), or pryout (ϕV_{cp}).

3. Steel capacity under tension loading:

D.5.1

$$\phi N_{sa} \geq N_{ua}$$

D.4.1.1

$$N_{sa} = 17,750 \text{ lb.}$$

This catalog

$$\phi = 0.75$$

This catalog

$$n = 1 \text{ (single anchor)}$$

Calculating for ϕN_{sa} :

$$\phi N_{sa} = 0.75 \times 1 \times 17,750 = 13,313 \text{ lb.} > 1,040 \text{ lb. O.K.}$$

Example Calculations Adhesive Anchors (ACI 318 App.D / ICC-ES AC308)

CALCULATIONS AND DISCUSSION

5. Adhesive anchor capacity under tension loading:

$$\phi N_a \geq N_{ua}$$

$$N_a = \frac{A_{Na}}{A_{Na0}} \psi_{ed,Na} \psi_{cp,Na} N_{ba}$$

$$N_{ba} = \tau_{k,cr} \pi d_a h_{ef} = 510(1.72)\pi(0.5)(4.5) = 6,200 \text{ lb.} \quad \text{Eq. (D-22)}$$

$$c_{Na} = 10d_a \sqrt{\frac{\tau_{k,uncr}}{1,100}} \quad \text{Eq. (D-21)}$$

$$c_{Na} = (10)(0.5) \sqrt{\frac{1,150(1.72)}{1,100}} = 6.70''$$

$$A_{Na0} = (2c_{Na})^2 = (13.40)^2 = 179.56 \text{ in.}^2 \quad \text{Eq. (D-20)}$$

$$A_{Na} = (c_{a1} + 2c_{Na})(2c_{Na}) = (1.75 + 6.70)(13.40) = 113.23 \text{ in.}^2$$

$$\psi_{ed,Na} = \left(0.7 + 0.3 \frac{c_{a,min}}{c_{Na}}\right) \leq 1.0 \quad \text{Since } c_{a,min} < c_{Na} \quad \text{Eq. (D-25)}$$

$$\psi_{ed,Na} = \left(0.7 + 0.3 \frac{c_{a,min}}{c_{Na}}\right) = \left(0.7 + 0.3 \frac{1.75}{6.70}\right) = 0.78$$

$$\psi_{cp,Na} = 1.0 \quad \text{D.5.5.5}$$

$$\phi = 0.65 \text{ for dry concrete} \quad \text{This catalog}$$

Calculating for ϕN_a :

$$\phi N_a = 0.65 \times \frac{113.23}{179.56} \times 0.78 \times 1.0 \times 6,200 = 1,982 \text{ lb.} > 1,040 \text{ lb. O.K.}$$

6. Check all failure modes under tension loading: D.4.1.1

Summary:

Steel capacity = 13,313 lb.

Concrete breakout capacity = 2,592 lb.

Adhesive capacity = 1,982 lb. ← **Controls**

∴ $\phi N_n = 1,982 \text{ lbs. as adhesive capacity controls}$

7. Steel capacity under shear loading: D.6.1

$$\phi V_{sa} \geq V_{ua}$$

$$V_{sa} = 10,650 \text{ lb.} \quad \text{This catalog}$$

$$\phi = 0.65 \quad \text{This catalog}$$

Calculating for ϕV_{sa} :

$$\phi V_{sa} = 0.65 \times 10,650 = 6,923 \text{ lb.} > 440 \text{ lb. O.K.}$$

CALCULATIONS AND DISCUSSION

8. Concrete breakout capacity under shear loading:

$$\phi V_{cb} \geq V_{ua}$$

$$V_{cb} = \frac{A_{Vc}}{A_{Vco}} \psi_{ed,V} \psi_{c,V} \psi_{h,V} V_b$$

where:

$$V_b = 7 \left(\frac{\ell_e}{d_a}\right)^{0.2} \sqrt{d_a} \lambda_a \sqrt{f'_c} c_{a1}^{1.5} \quad \text{Eq. (D-33)}$$

substituting:

$$\phi V_{cb} = \phi \frac{A_{Vc}}{A_{Vco}} \psi_{ed,V} \psi_{c,V} \psi_{h,V} 7 \left(\frac{\ell_e}{d_a}\right)^{0.2} \sqrt{d_a} \lambda_a \sqrt{f'_c} c_{a1}^{1.5}$$

where:

$\phi = 0.70$ for Condition B

(no supplementary reinforcement provided) D.4.4(c)(i)

$$A_{Vco} = 4.5c_{a1}^2 = 4.5(1.75)^2 \quad \text{Eq. (D-32)}$$

$$\therefore A_{Vco} = 13.78 \text{ in.}^2$$

$$A_{Vc} = 2(1.5c_{a1})(1.5c_{a1}) = 2(1.5(1.75))(1.5(1.75)) \quad \text{Fig. RD.6.2.1(a)}$$

$$= 2(1.5(1.75))(1.5(1.75))$$

$$\therefore A_{Vc} = 13.78 \text{ in.}^2$$

$$\therefore A_{Vc} = 13.78 \text{ in.}^2$$

$$\frac{A_{Vc}}{A_{Vco}} = \frac{13.78}{13.78} = 1$$

$$\frac{A_{Vc}}{A_{Vco}} = \frac{13.78}{13.78} = 1 \quad \text{D.6.2.1}$$

$$h_a = 12 \text{ in.}$$

$$\psi_{h,V} = 1.0 \text{ since } h_a > 1.5c_{a1} \quad \text{D.6.2.8}$$

$$\psi_{ed,V} = 1.0 \text{ since } c_{a2} > 1.5c_{a1} \quad \text{Eq. (D-37)}$$

$$\psi_{c,V} = 1.0 \text{ for cracked concrete} \quad \text{D.6.2.7}$$

$$d_a = 0.5 \text{ in.}$$

$$\ell_e = 8d_a = 8(0.5) = 4'' \quad \text{D.6.2.2}$$

$$\lambda = 1.0 \text{ for normal-weight concrete} \quad \text{8.6.1}$$

$$c_{a1} = 1.75 \text{ in.}$$

$$\phi V_{cb} = 0.70 \times 1 \times 1.0 \times 1.0 \times 1.0 \times 7 \times \left(\frac{4}{0.5}\right)^{0.2} \times \sqrt{0.5} \times 1.0$$

$$\times \sqrt{3,000} \times (1.75)1.5 = 666 \text{ lb.} > 440 \text{ lb. O.K.}$$

9. Concrete pryout capacity under shear loading: D.6.3

$$V_{cp} = \min[k_{cp} N_a; k_{cp} N_{cb}] \quad \text{D.6.3.1}$$

$$k_{cp} = 2.0 \text{ for } h_{ef} \geq 2.5''$$

$$N_a = 3,050 \text{ lb. from adhesive-capacity calculation without } \phi \text{ factor}$$

$$N_{cb} = 3,988 \text{ lb. from concrete-breakout calculation without } \phi \text{ factor}$$

$$V_{cp} = (2.0)(3,050) = 6,100 \text{ lb. controls}$$

$$\phi = 0.7$$

This catalog

$$\phi V_{cp} = (0.7)(6,100) = 4,270 \text{ lb.} > 440 \text{ lb. O.K.}$$

Continued on next page

Example Calculations Adhesive Anchors (ACI 318 App.D / ICC-ES AC308)

CALCULATIONS AND DISCUSSION

REFERENCE

10. Check all failure modes under shear loading:

D.4.1.1

Summary:

Steel capacity = 6,923 lb.

Concrete breakout capacity = 666 lb. ← **Controls**

Pryout capacity = 4,270 lb.

∴ $\phi V_n = 666$ lb. as concrete breakout capacity controls

11. Check interaction of tension and shear forces:

D.7

If

$$\frac{V_{ua}}{\phi V_n} \leq 0.2$$

then the full tension design strength is permitted.

D.7.1

By observation, this is not the case.

If

$$\frac{N_{ua}}{\phi N_n} \leq 0.2$$

then the full shear design strength is permitted.

D.7.2

By observation, this is not the case.

Therefore:

$$\frac{N_{ua}}{\phi N_n} + \frac{V_{ua}}{\phi V_n} \leq 1.2$$

Eq. (D-42)

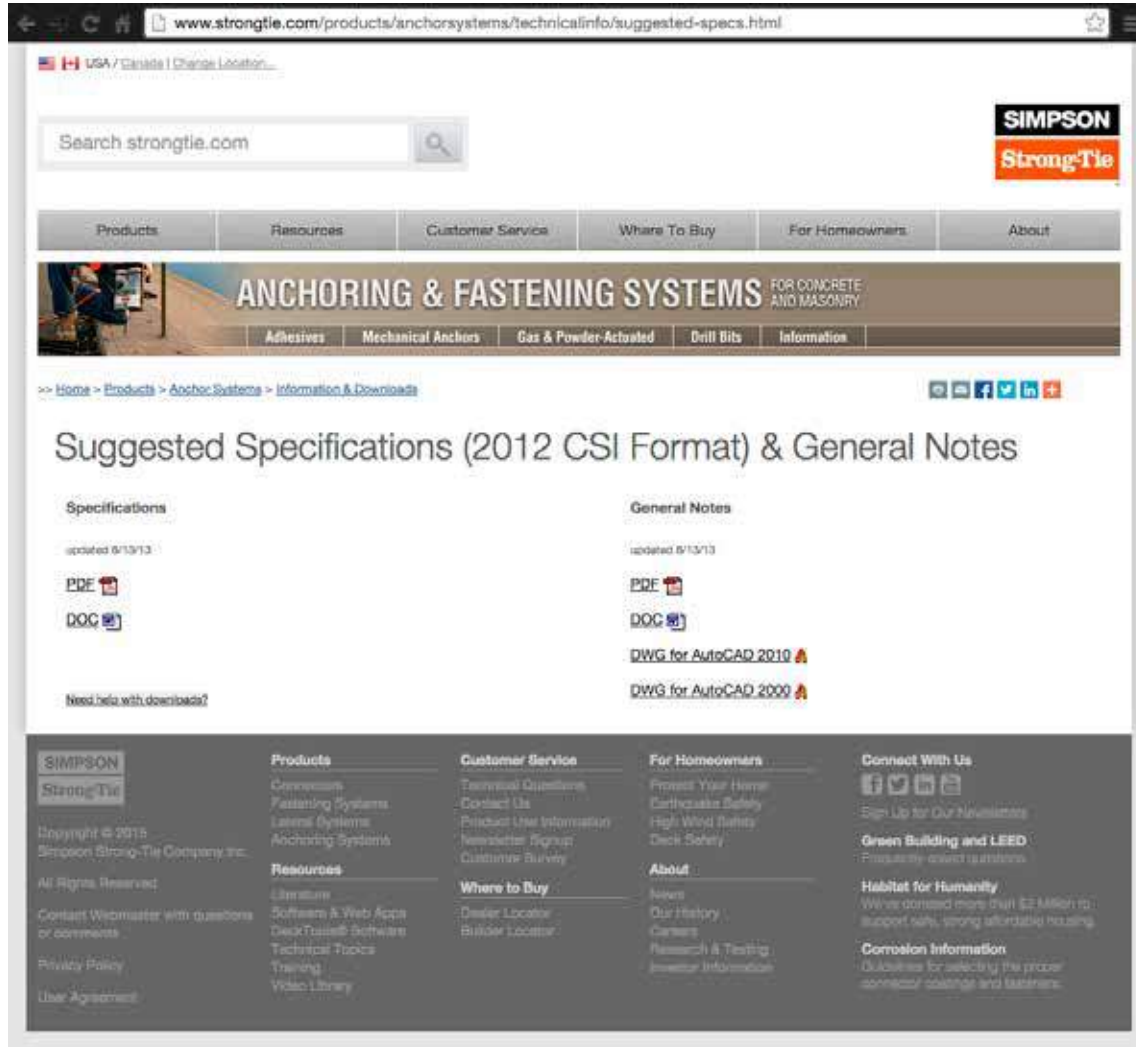

$$\frac{1,040}{1,982} + \frac{440}{666} = 0.52 + 0.66 = 1.18 < 1.2 \text{ O.K.}$$

12. Summary

A single ½" diameter ASTM A193 Grade B7 anchor rod in SET-XP® epoxy adhesive at a 4½" embedment depth is adequate to resist the applied strength level tension and shear wind loads of 1,040 lb. and 440 lb., respectively.

Suggested General Notes for Anchor Products

To download the full text of Suggested General Notes, please visit strongtie.com/products/anchorsystems/technicalinfo/suggested-specs.html.

Glossary

ACI — American Concrete Institute

ACRYLIC — Polymer based on resins prepared from a combination of acrylic and methacrylic esters.

ADHESIVE ANCHOR — Typically, a threaded rod or rebar that is installed in a predrilled hole in a base material with a two-part chemical compound.

ADMIXTURE — A material other than water, aggregate or hydraulic cement used as an ingredient of concrete and added to concrete before or during its mixing to modify its properties.

AERATED CONCRETE — Concrete that has been mixed with air-entraining additives to protect against freeze-thaw damage and provide additional workability.

AGGREGATE — A granular material, such as sand, gravel, crushed stone and iron blast-furnace slag, used with a cementing medium to form a hydraulic cement concrete or mortar.

AISC — American Institute of Steel Construction

ALLOWABLE LOAD — The maximum design load that can be applied to an anchor. Allowable loads for mechanical and adhesive anchors are based on applying a factor of safety to the average ultimate load.

ALLOWABLE STRESS DESIGN (ASD) — A design method in which an anchor is selected such that service loads do not exceed the anchor's allowable load. The allowable load is the average ultimate load divided by a factor of safety.

AMINE CURING AGENT — Reactive ingredient used as a setting agent for epoxy resins to form highly crosslinked polymers.

ANCHOR CATEGORY — The classification for an anchor that is established by the performance of the anchor in reliability tests such as sensitivity to reduced installation effort for mechanical anchors or sensitivity to hole cleaning for adhesive anchors.

ANSI — American National Standards Institute

ASTM — American Society for Testing and Materials

BASE MATERIAL — The substrate (concrete, CMU, etc.) into which adhesive or mechanical anchors are to be installed.

BOND STRENGTH — The mechanical interlock or chemical bonding capacity of an adhesive to both the insert and the base material.

BRICK — A solid masonry unit of clay or shale formed into a rectangular prism while plastic and burned or fired in a kiln that may have cores or cells comprising less than 25% of the cross sectional area.

CAMA — Concrete Anchor Manufacturer's Association

CAST-IN-PLACE ANCHOR — A headed bolt, stud or hooked bolt installed into formwork prior to placing concrete.

CHARACTERISTIC DESIGN VALUE — The nominal strength for which there is 90% confidence that there is a 95% probability of the actual strength exceeding the nominal strength.

CONCRETE — A mixture of Portland cement or any other hydraulic cement, fine aggregate, coarse aggregate and water, with or without admixtures. Approximate weight is 150 pcf.

CONCRETE BRICK — A solid concrete masonry unit (CMU) made from Portland cement, water, and aggregates.

CONCRETE COMPRESSIVE STRENGTH (f'_c) — The specified compressive load carrying capacity of concrete used in design, expressed in pounds per square inch (psi) or megapascals (MPa).

CONCRETE MASONRY UNIT (CMU) — A hollow or solid masonry unit made from cementitious materials, water and aggregates.

CORE DRILL — A method of drilling a smooth wall hole in a base material using a special drill attachment.

CREEP — Displacement under a sustained load over time.

CURE TIME — The elapsed time required for an adhesive anchor to develop its ultimate carrying capacity.

DESIGN LOAD — The calculated maximum load that is to be applied to the anchor for the life of the structure.

DESIGN STRENGTH — The nominal strength of an anchor calculated per ACI 318, ICC-ES AC193 or ICC-ES AC308 and then multiplied by a strength reduction factor (ϕ).

DROP-IN ANCHOR — A post-installed mechanical anchor consisting of an internally-threaded steel shell and a tapered expander plug. The bottom end of the steel shell is slotted longitudinally into equal segments. The anchor is installed in a pre-drilled hole using a hammer and a hand-setting tool. The anchor is set when the tapered expander plug is driven toward the bottom end of the anchor such that the shoulder of the hand-setting tool makes contact with the top end of the anchor. A drop-in anchor may also be referred to as a displacement controlled expansion anchor.

DYNAMIC LOAD — A load whose magnitude varies with time.

EDGE DISTANCE:

EDGE DISTANCE (C) — The measure between the anchor centerline and the free edge of the concrete or masonry member.

CRITICAL EDGE DISTANCE (C_{cr} or C_{ac}) — The least edge distance at which the allowable load capacity of an anchor is applicable without reductions.

MINIMUM EDGE DISTANCE (C_{min}) — The least edge distance at which the anchors are tested for recognition.

EFFECTIVE EMBEDMENT DEPTH — The dimension measured from the concrete surface to the deepest point at which the anchor tension load is transferred to the concrete.

EMBEDMENT DEPTH — The distance from the top surface of the base material to the installed end of the anchor. In the case of a post-installed mechanical anchor, the embedment depth is measured prior to application of the installation torque.

EPOXY RESIN — A viscous liquid containing epoxide groups that can be crosslinked into final form by means of a chemical reaction with a variety of setting agents.

EXPANSION ANCHOR — A mechanical fastener placed in hardened concrete or assembled masonry, designed to expand in a self-drilled or predrilled hole of a specified size and engage the sides of the hole in one or more locations to develop shear and/or tension resistance to applied loads without grout, adhesive or drypack.

FATIGUE LOAD TEST — A test in which the anchor is subjected to a specified load magnitude for 2×10^6 cycles in order to establish the endurance limit of the anchor.

Glossary

GEL TIME — The elapsed time at which an adhesive begins to increase in viscosity and becomes resistant to flow.

GROUT — A mixture of cementitious material and aggregate to which sufficient water is added to produce pouring consistency without segregation of the constituents.

GROUTED MASONRY (or GROUT-FILLED MASONRY) — Hollow-unit masonry in which the cells are filled solidly with grout. Also, double or triple-wythe wall construction in which the cavity(s) or collar joint(s) is filled solidly with grout.

HOT-DIP GALVANIZED — A part coated with a relatively thick layer of zinc by means of dipping the part in molten zinc.

IAPMO UES — IAPMO Uniform Evaluation Service. An ISO 17065 ANSI-accredited company that issues evaluation reports expressing a professional opinion as to a product's building code compliance.

IBC — International Building Code.

ICC-ES — ICC Evaluation Service. An ISO 17065 ANSI-accredited company that issues evaluation reports expressing a professional opinion as to a product's building code compliance.

LEGACY ACCEPTANCE CRITERIA — A past version of an ICC-ES anchor qualification criteria. These are no longer current standards, but are the basis for legacy allowable load data for anchors in concrete. These standards have been replaced by modern standards such as ICC-ES AC193 and AC308.

LIGHTWEIGHT CONCRETE — Concrete containing lightweight aggregate. The unit weight of lightweight concrete is not to exceed 115 pcf.

MASONRY — Brick, structural clay tile, stone, concrete masonry units or a combination thereof bonded together with mortar.

MECHANICALLY GALVANIZED — A part coated with a layer of zinc by means of mechanical impact. The thickest levels of mechanical galvanizing (ASTM B695, Class 55 or greater) are considered to be alternatives to hot-dip galvanizing and provide a medium level of corrosion resistance.

MORTAR — A mixture of cementitious materials, fine aggregate and water used to bond masonry units together.

NOMINAL STRENGTH — The strength of an element as calculated per ACI 318, ICC-ES AC193 or ICC-ES AC308.

NORMAL WEIGHT CONCRETE — Concrete containing normal weight aggregate. The unit weight of normal weight concrete is approximately 150 pcf.

OBLIQUE LOAD — A load that is applied to an anchor, which can be resolved into tension and shear components.

PLAIN CONCRETE — Structural concrete with no reinforcement or with less reinforcement than the minimum specified for reinforced concrete.

PORTLAND CEMENT — Hydraulic cement consisting of finely pulverized compounds of silica, lime and alumina.

POST-INSTALLED ANCHOR — Either a mechanical or adhesive anchor installed in a pre-drilled hole in the base material.

POST-TENSION — A method of prestressing in which tendons are tensioned after concrete has hardened.

POT LIFE — The length of time a mixed adhesive remains workable (flowable) before hardening.

PRECAST CONCRETE — A concrete structural element cast elsewhere than its final position in the structure.

PRESTRESSED CONCRETE — Structural concrete in which internal stresses have been introduced to reduce potential tensile stresses in concrete resulting from loads.

PRETENSIONING — A method of prestressing in which tendons are tensioned before concrete is placed.

REBAR — Deformed reinforcing steel which comply with ASTM A615.

REINFORCED CONCRETE — Structural concrete reinforced with no less than the minimum amount of prestressed tendons or nonprestressed reinforcement specified in ACI 318.

REINFORCED MASONRY — Masonry units and reinforcing steel bonded with mortar and/or grout in such a manner that the components act together in resisting forces.

REQUIRED STRENGTH — The factored loads and factored load combinations that must be resisted by an anchor.

SCREEN TUBE — Typically a wire or plastic mesh tube used with adhesives for anchoring into hollow base materials to prevent the adhesive from flowing uncontrolled into voids.

SCREW ANCHOR — A post-installed anchor that is a threaded mechanical fastener placed in a predrilled hole. The anchor derives its tensile holding strength from the mechanical interlock of the fastener threads with the grooves cut into the concrete during the anchor installation.

SHEAR LOAD — A load applied perpendicular to the axis of an anchor.

SHOTCRETE — Concrete that is pneumatically projected onto a surface at high velocity. Also known as gunite.

SLEEVE ANCHOR — A post-installed mechanical anchor consisting of a steel stud with nut and washer, threaded on the top end and a formed uniform tapered mandrel on the opposite end around which a full length expansion sleeve formed from sheet steel is positioned. The anchor is installed in a predrilled hole and set by tightening the nut by torquing thereby causing the expansion sleeve to expand over the tapered mandrel to engage the base material.

SPACING:

SPACING (S) — The measure between anchors, centerline-to-centerline distance.

CRITICAL SPACING (S_{cr}) — The least anchor spacing distance at which the allowable load capacity of an anchor is applicable such that the anchor is not influenced by neighboring anchors.

MINIMUM SPACING (S_{min}) — The least anchor spacing at which the anchors are tested for recognition.

STAINLESS STEEL — A family of iron alloys containing a minimum of 12% chromium. Type-316 stainless steel provides greater corrosion resistance than Types 303 or 304.

STANDARD DEVIATION — As it pertains to this catalog, a statistical measure of how widely dispersed the individual test results were from the published average ultimate loads.

Glossary

STATIC LOAD — A load whose magnitude does not vary appreciably over time.

STRENGTH DESIGN (SD) — A design method in which an anchor is selected such that the anchor's design strength is equal to or greater than the anchor's required strength.

STRENGTH REDUCTION FACTOR (ϕ) — A factor applied to the nominal strength to allow for variations in material strengths and dimensions, inaccuracies in design equations, required ductility and reliability, and the importance of the anchor in the structure.

TENDON — In pretensioned applications, the tendon is the prestressing steel. In post-tensioned applications, the tendon is a complete assembly consisting of anchorages, prestressing steel, and sheathing with coating for unbonded applications or ducts with grout for bonded applications.

TENSION LOAD — A load applied parallel to the axis of an anchor.

THIXOTROPIC — The ability of a fluid to become less viscous (resistant to flow) under shear, then thicken when the shear force is removed.

TORQUE — The measure of the force applied to produce rotational motion usually measured in foot-pounds. Torque is determined by multiplying the applied force by the distance from the pivot point to the point where the force is applied.

ULTIMATE LOAD — The average value of the maximum loads that were achieved when five or more samples of a given product were installed and statically load tested to failure under similar conditions. The ultimate load is used to derive the allowable load by applying a factor of safety.

UNDERCUT ANCHOR — A post-installed anchor that develops its tensile strength from the mechanical interlock provided by undercutting of the concrete at the embedded end of the anchor.

UNREINFORCED MASONRY (URM) — A form of clay brick masonry bearing wall construction consisting of multiple wythes periodically interconnected with header courses. In addition, this type of wall construction contains less than the minimum amounts of reinforcement as defined for reinforced masonry walls.

WEDGE ANCHOR — A post-installed mechanical anchor consisting of a steel stud with nut and washer, threaded on the top end and a formed uniform tapered mandrel on the opposite end around which an expansion clip formed from sheet steel is positioned. The anchor is installed in a predrilled hole and set by tightening the nut by torquing, thereby causing the expansion clip to expand over the tapered mandrel to engage the base material. A wedge anchor may also be referred to as a torque controlled expansion anchor.

WYTHE — A continuous vertical section of masonry one unit in thickness.

ZINC PLATED — A part coated with a relatively thin layer of zinc by means of electroplating.

PDPAW	0.157” Shank Diameter with ¾” Metal Washer	253, 266
PDPAWL	0.157” Shank Diameter with 1” Metal Washer	253, 266
PDPWLSS	0.145” Shank Diameter and 1” Metal Washer – Type-304 Stainless Steel	253, 268
PECLDPA	Ceiling Clip	253, 267
PEPT	Pole Tool / Accessories	252
PEPT-LR	Pole Tool / Accessories	252, 257, 259
PHBC	Highway Basket Clip	253, 269
PHD	Hammer Drive Pin	272

Alphabetical Index of Products

PHN	8mm Head Pin	253, 270
PHNT	8mm Tophat Fastener	253, 271
PHNW	8mm Headed Pin with 1" Washer	253, 271
PHT	Hammer Drive Tool	272
PINW	100 through 300 – 0.300" Headed Pin with 1 7/16" Washer	253, 268
PINWP	100 through 300 – 0.300" Headed Pin with 1 7/16" Plastic Washer	253, 268
PKP	Concrete Forming Pin	253, 272
PSLV3	3/8" Threaded Stud	253, 270
PSLV4	1/4" Threaded Stud	253, 269
PT-22A	.22 Cal. Powder-Actuated Tool	253, 255, 262
PT-22HA	Hammer-Activated Powder Tool	253, 255, 263
PT-22P	Powder-Actuated Tool	253, 255, 264
PT-27	.27 Cal. Powder-Actuated Tool	252, 253, 255, 261
PT-27HDA	Heavy-Duty Powder-Actuated Tool	253, 255, 260
PTP-27L	.27 Cal. Auto Powder-Actuated Tool	252–254, 256–257
PTP-27LMAGR	.27 Cal. Auto Powder-Actuated Tool with Magazine	252–254, 256–257
PTP-27S	.27 Cal. Auto Powder-Actuated Tool	252–254, 258–259
PTP-27SMAGR	.27 Cal. Auto Powder-Actuated Tool with Rotating Magazine	252–254, 258–259
PTRHA	0.157" Shank Diameter Threaded Rod Hanger	253, 267
RFB	Retrofit Bolt	135
RWH	Horizontal Wood Rod Hanger	212–213
RWV	Vertical Wood Rod Hanger	212–213
SET	Epoxy Adhesive	102–121
SET-XP®	Epoxy Adhesive	38–61
SL	Sleeve-All® Anchor	180–183
STB2	Strong-Bolt® 2 Wedge Anchor	144–163
SWN	Sure Wall Anchor – Nylon	245
SWZ	Sure Wall Anchor – Zinc	245
TCA	Torq-Cut™ Anchor	138–143
THD	Titen HD® Heavy-Duty Screw Anchor	184–199
THDB	Titen HD® Heavy-Duty Screw Anchor	184–199
THD RC	Titen HD® Rod Coupler	201–202
THD RH	Titen HD® Rod Hanger	208–211
TTN	Titen® Concrete and Masonry Screw	203–204
TTNSS	Titen® Concrete and Masonry Screw – Stainless Steel	205–206
TTNT	Titen® Screw Installation Tool	207
TW	Tie Wire Anchor	177–178
WA	Wedge-All® Anchor	164–176
ZN	Zinc Nailon™	241

Powerful calculations, *Concrete solutions*

Performing challenging calculations required by current design methodologies can be completed quickly and accurately with the new Simpson Strong-Tie® Anchor Designer™ software. A fully interactive 3D graphical-user interface with 42 pre-loaded anchor configurations simplify input, and calculation results are output for verification and submission of your design. Anchor Designer complies with current ACI 318, ETAG and CSA code requirements.

Call (800) 999-5099 to learn more and download the free software at strongtie.com/anchordesigner.
